ERP! Excuse us as we digest our new system

► Ripple effect can hurt customer service

By Barb Cole-Comolli
SEATTLE

IF IT'S TAKING longer to get an answer when you call your bank's customer service line, it may be the result of a new enterprise resource planning system.

A lot of companies are installing ERP systems, and that's having a ripple effect on customer service, according to attendees at the International Customer Service Association conference. In fact, during the first six months of an ERP implementation, customer service levels are likely to decline, attendees said.

"We were supposed to be able to do online orders, but the system is too slow," said Mary Phillippi, a customer service manager at United Sugars Corp. in Moorhead, Minn., which installed SAP AG's R/3 about 18 months ago.

Phillippi said United Sugars has been unable to process orders fast enough while customers wait on the phone. Because of that, it has resorted to taking orders by hand or fax on paper forms, then typing the information into the system.

ERP systems can seem slower than legacy applications because customer service representatives no longer use a stand-alone system. Instead, they access a database that is

ERP, page 100

The Web will be key to improving customer service over time, experts say.

USERS, VENDORS RALLY AROUND EMERGING STANDARD

By Carol Shinn

AN EMERGING standard for Web procurement will take center stage this week at the Internet Commerce Expo in Los Angeles. That's where major backers plan to demonstrate that Open Buying on the Internet — the industry-defined standard designed to help businesses procure low-cost, high-volume goods online — is finally up and running.

Yet OBI adoption remains slow, as companies either get up to speed with the standard or continue to plot their electronic-commerce strategies, industry observers said.

"The standard has a chance of gaining traction as other or-

ganizations see leading adopters like Ford (Motor Co.) implement the [OBI] elements that are viable," said Roy Satterthwaite, an analyst at Gartner Group, Inc. in Stamford, Conn. He said he expects that will take 18 to 24 months.

OBI specifies the process by which buyers gain access to the supplier's catalog, the data structure, purchase order format, transmission mechanism, digital signature scheme and authentication model.

With a more stable OBI 1.1 out since June, OBI proponents finally are ready to show that, through OBI, procurement software on the buyer company's side can interoperate with catalog/processing software on the seller's side.

For buyers, that means they won't have to host supplier catalogs on their intranets. Instead, they can let suppliers maintain the catalogs behind their company firewalls.

So far, however, the limited number of companies that are

Details sketchy on SAP pricing, interface fix

By Craig Stedman
LOS ANGELES

AS IT TRIES to be more than a more people, SAP AG is facing up to the need to make big changes in the way its business applications are designed, packaged and priced.

But SAP executives haven't come up with all the answers yet. At the German company's Sapphire '98 conference here last week, many of the promised changes were still grounded more in vision than in reality.

For example, CEO Hasso Plattner said SAP is going back to the drawing board and re-vamping its whole approach to

EXECUTIVE Briefing

News summary for senior managers

■ An astonishing number of companies ignore even the most basic electronic security steps, according to a *Computerworld*/Ernst & Young poll. And the situation is getting worse as users pull money away from security to help with year 2000 repairs. Awareness has increased, but one-third of respondents still identified security as the biggest barrier to electronic commerce. Business unit managers should push for improvements, which can cost as little as \$150,000 for a \$50 million business, analysts say. But don't forget that hackery isn't the only way to get taken; keep an eye on your accountants, too. Page 70

■ Enterprise resource planning systems can hurt customer service for the first six months because they can be slower than stand-alone customer service systems. Customer service staff expect the systems to improve service by giving data to customers through Web browsers, but they still face problems with security and how to the applications to ERP. Page 1

■ Mercedes-Benz is setting up a site that will let customers with questions ask for a call from a service rep. The combination of the Web and the telephone is innovative, analysts say, and shows how a site can provide more than just advertising for hard-goods dealers. Page 4

■ Internet-related job titles don't always reflect reality because the jobs change so much. So firms hire by skill set, not title. But the gap between an infrastructure technician and a business-support guru is widening, and the latter is becoming more important. People with both skill sets can practically write their own tickets. Profiles of a webmaster, a business technologist and an electronic-commerce expert show how they got where they are. Page 81

■ Microsoft is fencing with the Department of Justice, deflating some of the antitrust charges while losing points on complaints that it pressured Intel, Apple and AOL. And Oracle's Larry Ellison revises the story that Microsoft got Digital to kill a network computer. Analysts say it hardly matters — there are too many other problems for network computers for them to do well. Page 8

■ The Starr report on the White House sex scandal burned up the Internet when it was released. Many sites got swamped, but some planned ahead and were able to keep up. Keys included breaking the file into pieces, keeping pages simple, off-loading and serving to secondary machines and making sure the primary Web servers didn't have to query other databases before serving pages. Page 49

■ Internet addiction is no joke to some people, whose marriages and lives are disrupted because of it. Whether or not it's a real addiction, it's a real problem, therapists say. Now it's turning up in businesses, sapping productivity as workers surf compulsively. Page 78

Are IT beggars too choosy?

► Picky recruiters seek to curb turnover

By Barb Cole-Gomolski

IN SPITE of the labor drought, IS departments appear to be getting pickier about whom they hire.

The seeming paradox is the result of efforts to reduce soaring turnover rates. By making the interviewing process more rigorous, information systems managers said they have a better chance of choosing candidates who will stick around.

"We have to do a better job up front of getting to know the candidate," said Tom Felton, vice president of corporate systems at Blockbuster Entertainment

Group in Dallas. At Blockbuster, that's done by conducting at least three in-person interviews and administering a logic test to all IS applicants.

In many companies, group interviewing is used to size up applicants' technical abilities and to get a read on what makes them tick. Other organizations are signing workers for short-term contracts before making them job offers.

MORE IS BETTER

Recruiters said clients are casting a wider net by interviewing more applicants before making offers. The goal is to determine

whether "this is the kind of person who wants to work here in the long term, or are they just interested in getting experience and moving to the next opportunity," said Joe Krafinski, a senior technical recruiter at Datacom Technology Group, Inc., an information technology placement firm in New York.

A year ago, it was possible for a systems analyst candidate to interview with one technical director and get a job offer.

Now, that same candidate may also have to interview with at least one other IS manager, and a group of peers," Krafinski said.

Several staffing managers said the more rigorous screen-

ing is helping IS departments find people who fit in better with the existing team. But it's too soon to tell whether the practice will reduce turnover rates, which are hovering around 25% for programmers and analysts at most sites, according to Stamford, Conn.-based Garner Group, Inc.

THE DOWNSIDE

However, there are some negative side effects to the extra interviews. "It takes longer to get somebody into the position this way," said Kerian Vogel, director of research at Seek Consulting, Inc., an IS staffing and research firm in Wakefield, Mass. While the search is on, existing employees have to pick up the extra work that is created when a job is left unfilled.

Moreover, top candidates are often courted by several companies, so companies that drag the hiring process out too long risk losing recruits to other contenders, Krafinski said.

Elliot Morris, a self-employed software engineer in Fountain Hills, Ariz., sees other drawbacks. "Companies become so picky that you can't get hired," he said.

Morris said he has had several initial phone interviews in which he has been asked a

PRELUDE TO AN OFFER

IS applicants typically go through these steps before getting an offer:

- 1 Get screened by human resources, either by telephone or in person*
- 2 Pass a technical test that may be administered by HR or IS
- 3 Interview with the IS manager who will be the applicant's boss
- 4 Interview with several members of the IS team with whom the applicant will work
- 5 Interview with another IS manager or members of other IS teams**

*This step is provided by an interviewer with a headhunter if the applicant registers with a placement firm.

**Optional at many companies

string of technical questions. If you can't answer the questions, you don't get the interview, according to Morris. He has also been subjected to group interviews, which put him off. "I think companies are missing out on some talented people because they are being too rigid" about their hiring practices, Morris said. □

Mercedes-Benz uses 'teleweb' technology for luxury service

By Bob Wallace

IN AN INNOVATIVE auto industry effort, Mercedes-Benz is combining call center and Internet technology to provide luxury-class customer service. The so-called "teleweb" technology lets consumers talk to representatives while navigating the company's Web site.

Mercedes-Benz of North America, Inc. in Montvale, N.J., is one of the first companies in the auto industry to use the World Wide Web/telephone technology to give consumers a fast and easy way to have their questions answered without placing a call. Last week, Mercedes-Benz outlined its strategic plans to expand that technology to more areas of its Web site.

The auto industry's Internet sites should move beyond mere advertising and toward a more interactive experience for consumers, said Chris Denove, director of consulting operations at J. D. Power and Associates in Agoura Hills, Calif. "What Mercedes is doing is a perfect step in that direction," Denove said.

The implementation works this way: Consumers who want more information after visiting the frequently asked questions or accessories section of Mercedes-Benz's Web site can key in their telephone number. It is transmitted to the automaker's 45-agent call center, where in a

matter of seconds an agent calls the consumer to field additional questions.

"We're doing anything and everything we can with technology to enhance our relationship with current and potential customers," said William Hurley, manager of new media and relationship marketing at Mercedes-Benz. "The Internet should not preclude use of the phone."

The Web/call center integration is made possible by AT&T

Corp.'s Instant Answer software, which resides on the Mercedes server and in AT&T's WorldNet network, Hurley said.

"Teleweb [technology] is definitely appropriate for providing high-touch customer service," said David Cooperstein, an analyst at Forrester Research, Inc. in Cambridge, Mass. "And if you look at the demographics, Mercedes-Benz customers are aggressively online and would benefit."

Mercedes-Benz plans to apply Instant Answer software to the Web site's auto-configuration page. It also plans to tie the call center to the Web site's dealer locator. After finding the closest dealer, consumers will be able to send their telephone number to the dealership and have a sales staffer call back to discuss the availability and price of a particular Mercedes model.

The dealer connection piqued the interest of one Mercedes-Benz dealership executive.

"That's quite an impressive capability," said Wayne Fitkin, MIS director at Fletcher Jones Motor Cars in Newport Beach, Calif. "With the Internet, consumers can see a virtual storefront but don't have a person to talk to."

"What's so unique about this is that I could interact directly with an already interested consumer and find a particular car in a moment or two," he said. □

Push for common Unix drivers

IN THE LATEST attempt to bridge the gap between the various versions of Unix, a group of leading vendors is planning a standard interface that will make it easier to write device drivers for Intel-based Unix servers.

The group includes Intel Corp., Compaq Computer Corp.'s Digital Equipment Corp.

subsidiary, IBM, Hewlett-Packard Co., SCO, Inc. and Sun Microsystems, Inc. A reference implementation of the interface framework will be distributed as freeware to the industry, and products that comply with the new specification are expected around the middle of next year.

—Robert L. Scheier

Corrections

The story "An Expanding Universe" in the Sept. 14 special report on enterprise resource planning misidentified the software vendor Alco Rubber Products, Inc. used for financial and distribution management functions. It is Platinum Software Corp. in Irvine, Calif.

A Sept. 7 news story, "FedEx taps software to manage databases," mischaracterized Federal Express Corp.'s daily shipments. FedEx ships 3 million packages per day.

An Aug. 31 Review Column feature, "Analyst Advisory," listed incorrect revenue data for Garner Group, Inc. Garner reported 1997 revenue of \$91.1 million.

IS YOUR BACKUP TOUGH ENOUGH FOR THE JOB?

Is your critical data guarded by a puny backup solution that doesn't scale up? Feds allow 56-bit encryption

► Change not quite enough for some critics

By Sharon Gaudin

CORPORATE users and industry watchers say the government's easing of encryption regulations last week should mean cheaper and more secure communication with their offices, plants and customers abroad.

After months of wrestling among the Commerce Department, the Federal Bureau of Investigation and the National Security Agency, the Clinton administration changed its encryption policy to allow the export of 56-bit Data Encryption Standard (DES) software.

The change will let multi-

national companies pass secure information across the Internet or an intranet without splicing together a tangle of U.S.- and foreign-made encryption software or jumping through a series of legal hoops to use the same encryption technology abroad as they do at home.

"We use Lotus Notes, and we've had to use the international version, which has lesser encryption, because of the government's policy," said Hilary Fuchs, assistant vice president of information systems at Continental Grain Co. in New York.

"This is definitely something we've wanted. We've been deal-

ing with different levels of security here in the United States and in sites abroad. We want the same level wherever our employees are," he said.

The easing of regulations, however, falls short of what critics from the corporate and software vendor arenas wanted. The policy change still prohibits stronger encryption, such as 128-bit, which has yet to be broken. Two months ago, a group of decryption experts broke in to 56-bit encryption, though that feat is still regarded as difficult.

Jack Grimes, senior vice president of Visa International Service Association in San Francisco, said the U.S. is on the right path, but he added that he

What strength encryption do you require for remote access?

- 40-bit DES
- 56-bit DES
- 128-bit triple DES
- More than 128-bit
- Don't know

Base: 250 corporate users

Source: Catalyst by Best Group, Menlo Park, Calif.

needs 128-bit encryption for critical business and financial information.

"Fifty-six-bit might be fine for electronic mail, but if you're trying to secure financial transactions, you want the highest level you can get," Grimes said. "All encryption can be broken. It's a matter of making the cost to break the message exceed the value of the information in the message."

U.S. export policy has been focused on limiting the spread of advanced encryption hardware and software. Regulations prohibit the technology from being exported outside U.S. borders, whether by a vendor such as Microsoft Corp. that tries to sell it or by a firm that tries to

ship it to international offices, suppliers or buyers.

U.S. law enforcement agencies fear that if strong encryption technology gets into criminal or terrorist hands, it will pose a threat to American lives and the economy because the U.S. government won't be able to crack their communications.

Although a U.S. company could buy encryption software from a company in another country and distribute it throughout its supply and sales network, such encryption software is generally considered too weak to bother with. □

Now that you can encrypt, just do it, Frank Hayes writes. Page 12

Hackers disrupt N.Y. Times site

By Sharon Gaudin

IS ADMINISTRATORS at The New York Times were left scrambling all last week after a hard-hitting hacker attack that reminded news organizations that posting information online puts their credibility on the line.

"Obviously, anything that's a liability to the credibility of our information is of tremendous concern to us," said Rich Meola, editor in chief at The New York Times Electronic Media Co. in New York. "It's unnerving when something like this happens. Any provider of credible information on the Internet has to be concerned. It's a threat to everybody."

Matthew Kovac, an analyst at The Yankee Group in Boston, said he doesn't believe that most news organizations — or most companies — are on top of their online security. He added that this incident was a good wake-up call.

"They're just not prepared," he said. "Reporting the news and getting it online is a timely fashion is the first priority. A newspaper's credibility in one medium doesn't necessarily translate into another if you don't have effective security."

On Sunday, Sept. 13, The New York Times had to shut down its World Wide Web site for nine hours after unsuccessfully bat-

ting for control of the site with a group of hackers. The hackers replaced the newspaper's home page with pornographic pictures, obscenities and threats targeted at Times reporter John Markoff, who has covered computer hackers and published a book about it, *Take Down*.

A group calling itself Hackers for Guitles claimed responsibility for the attack. The FBI is investigating.

Four days later the Times still didn't have its complete Web site back online. Forums, classified, archives and the site's

search engine were still down while an information systems team tried to clean up the site and secure it.

Meola wouldn't specify the security measures the hackers broke through or what kind of changes are being made.

MONEY MAKES IT WORSE

But as much as news organizations have to worry about hackers changing stories and raising libel issues, it isn't the same as a financial institution having to protect people's finances, said Greg Cline, an analyst at Cahners Inc.-Sut Group in Newton, Mass. "Hacking into news organizations is generally done as a prank," Cline said. "Financial organizations are most vulnerable, and they have the highest fiduciary duty to protect their Web sites."

Chris Jennewein, vice president of technology and operations at Knight-Ridder News Media in San Jose, Calif., said the New York Times attack was a good reminder, but he has been aware that there was the potential for trouble.

"We've reviewed our security procedures [after last week], but we haven't decided to make any changes," Jennewein said. "We're always aware of security and credibility. Even on the print — even though we don't worry about hackers per se — we have to worry about accuracy. It's a natural transition."

Knight-Ridder has 40 newspapers online, including *The Miami Herald* and the *San Jose Mercury News*.

Scott Woelfel, editor in chief at CNN Interactive in Atlanta, said that because it is one of the most visible sites on the Web, staffers have learned to be cautious. And so far, the site hasn't been hacked.

Hackers tend to be visible, going for the splashy show instead of changing a quote or a number, Woelfel said.

Paul Grabowicz, coordinator of the New Media Program at the University of California at Berkeley Graduate School of Journalism, agreed.

"One thing about hackers is that they're not subtle," he said. "And people aren't fools. When they see hack jobs, they're not likely to assume the people at The New York Times lost their sanity for a day." □

Staff writer Nancy Dillon contributed to this story.

Tandem to run on Alpha chip

By April Jacobs

COMPAQ COMPUTER CORP. will move its highest-end Tandem Himalaya servers to the Digital Alpha chip in Mips in 1999.

The announcement marries two technology families acquired by Compaq in the past year: Tandem Computers, Inc.'s Himalaya S series servers used by financial institutions and telephone carriers, which were designed to keep working if components fail; and Digital Equipment Corp.'s 64-bit Alpha processor line.

Compaq officials said the move is intended to ally consumers may have about the future of the Mips Technologies, Inc. processor now powering the Himalaya servers. The Mips processor, once used by several computer makers, is a leading chip architecture for consumer appliances and video games. Silicon Graphics, Inc. retains a majority stake in Mips.

Pauline Nist, vice president and general manager at the Tandem division of Compaq, said Compaq and Tandem are assuring Himalaya users con-

sidering migration plans that upgrading to Alpha-based servers won't require changes.

Tandem migrated its Himalaya users from its proprietary RISC chip to Mips in 1991.

That migration was smooth because Tandem provided a way for its users to keep their current applications running.

It worked so well, according to Nist, that about 60% of Tandem's users are still running their original application code.

"We are going to commit to doing the same thing this time around," Nist said.

Himalaya with Alpha will have all the same features, Nist said. The company's three-year time frame for release is based on the fact that the next-generation Evy Alpha chip isn't slated for release until 2000.

Ed Schaefer, an analyst at The Standish Group International, Inc. in Dennis, Mass., said Tandem users would benefit from the vendor's experience in changing processor types.

Then there's the performance of the chips slated for the Himalaya. "When we look at the performance category, Alpha is the undefeated heavyweight champion," he said. □

Microsoft requests mostly denied

► Already-delayed trial pushed back to Oct. 15

By Stewart Dick

IT'S THE antitrust cha-cha. For every step toward an actual trial taken by the Department of Justice in its antitrust case against Microsoft Corp., it seems to take a step sideways and, at times, half a step backward.

Even so, the parameters of the trial—which originally was set to begin Sept. 8—are slowly coming into focus as the

Jackson did agree to dismiss a claim that Microsoft had tried "to foreclose competition" in Internet browsers.

case moves forward. He said that there were "many material issues of fact genuinely in dispute," including whether Microsoft was a monopolist and had used such status in illegal ways. The judge also noted Microsoft's argument that Windows was protected from state antitrust laws because it had a federal copyright. "A copyright does not give its holder immunity from laws of general applicability, including antitrust laws," Jackson wrote.

Microsoft then requested that the case be delayed further and asked that the DOJ's case be limited. The Department of Justice wants to introduce additional evidence from Microsoft's MS-DOS operating system days, but Microsoft argued that was already covered in the 1995 consent decree settlement it signed with the DOJ.

Microsoft also tried unsuccessfully to limit evidence about pressure it allegedly applied to Intel Corp., Apple Computer, Inc. and RealNetworks, Inc. on various business dealings.

Most recently, America Online, Inc. CEO Steve Case prepped up to support a DOJ allegation that Microsoft violated antitrust law in its dealings with America Online. Microsoft supposedly used its operating system influence to get America Online to make Microsoft's Internet Explorer the default

Internet browser for its users.

Case said last week that although other browsers were comparable, he agreed to the deal for preferential placement in the Windows 95 desktop and because the

browser was free.

One legal expert said Microsoft has solid grounds for its requests. "I think Microsoft is right in basically saying, 'We've been working like crazy to meet unrealistic deadlines. Now all of a sudden we're being surprised

by additional allegations,'" said Marc Schildkraut, a former antitrust attorney at the Federal Trade Commission and now a partner at Howrey & Simon, a Washington law firm.

Microsoft did win one, however, when Jackson agreed to dismiss the states' claim that the company used its monopoly power in operating systems "to foreclose competition" in Internet browsers. The Supreme Court has upheld similar charges "only when [a company] actually monopolizes or danger-

ously threatens to do so," Jackson wrote. Microsoft officials last week claimed that the company had never tampered with evidence requested for the case.

"The government has never alleged that Microsoft has destroyed any documents or withheld any information that it was required to provide," said Microsoft spokesman Mark Murray, responding to reports that the government was looking into these issues. "Obviously we are in daily contact with the government, and they have never indicated to us that they are looking at these groundless allegations," Murray said.

Officials at the DOJ declined to discuss the matter. □

Gates' NC role is debated anew

By Kim S. Nash

and April Jacobs

A REPORT OF Microsoft Corp. CEO Bill Gates pressuring Digital Equipment Corp. to drop a network computer project because it didn't support Microsoft technologies isn't new.

The tale appeared in several reports from industry newsletters late last year and early this year.

But in his own recent retelling, Oracle Corp. CEO Larry Ellison managed to fan the flames against Microsoft just as the government last week revealed it was investigating similar charges of Microsoft intimidation of other vendors, such as Intel Corp.

While some pundits talk about what might have been had Digital gone ahead with its "Shark" network computer,

cynics suggest that Ellison is looking to explain why the network computer hasn't been a barn burner. Despite its well-known resistance to the concept, Microsoft isn't solely to blame for disappointing network computer sales, analysts said.

There are plenty of other problems facing the network computer, including overselling of the concept and unfriendly technical hurdles, they said.

For example, part of network computers' appeal is that they are cheaper than PCs, mainly because they lack local storage and other expensive add-ons. But because network computers can't store much software, they require fast, high-capacity networks to serve the software to users.

That, for many customers, is a stumbling block.

SLIM CHANCE

Even if Digital didn't drop its Shark project—which Ellison and other sources claim happened after tense talks with an unhappy Gates—network computers probably wouldn't have taken off more than they have, said Kevin Knox, an analyst at Gartner Group, Inc. in Stamford, Conn.

Microsoft declined to comment, other than to say that

it and Digital, which is now owned by Compaq Computer Corp., have a "great relationship."

"You're downgrading the quality of the product," he said. "I don't want to talk about it."

Shark was Digital's code name for hardware built to specifications created by the anti-Microsoft contingent of Oracle, Sun Microsystems, Inc. and others. Today, Digital supports Microsoft's thin-client specifications.

"There are some pretty big names [still selling network computers] anyway, so I don't know if the Digital/Oracle combination would have had much effect," Knox said.

Some users initially intrigued by the network computer concept have since backed off.

Federal Express Corp. in Memphis originally planned to install hundreds of Sun's JavaStation network computers. But as the price of beefy PCs dropped to about \$1,000, FedEx early this year decided to stick with PCs and continue to test network computers for the next few years [CW, Feb. 23].

Ellison's overzealous sales talk also has contributed to disappointment with network computers, said Eileen O'Brien, an analyst at International Data Corp., a sister company to Computerworld, in Framingham, Mass. □

battle lines are becoming more clear. In a flurry of decisions last week, U.S. District Judge Thomas Penfield Jackson denied Microsoft's request to dismiss the suit, pushed back the trial date three weeks, trimmed a piece of the states' portion of the DOJ case against the industry giant and declined—for now—to limit the government's case.

Both sides had requested a delay to continue preparing for the trial, which Jackson rescheduled to Oct. 15 from Sept. 23. In a 56-page ruling, Jackson denied Microsoft's request to dis-

Feature-rich IBM router to make debut

By Bob Willace

USERS STAND TO gain solely needed versatility in one branch office box with IBM's introduction this week of a feature-rich router, the first to let remote sites boot up thin clients.

The Access Unity promises to speed the booting process by handling it locally rather than requiring companies to send 4M-byte-plus images to remote sites over expensive and narrow wide-area network links.

The product was designed to handle all the networking needs of branch offices. It has traditional router features as well as virtual private network (VPN) and remote access functionalities. And voice support is planned.

"All this functionality has not been available in a single box," said John Morency, vice president at Renaissance Worldwide, Inc., a Newton, Mass.-based consulting and research firm. "And their thin-client support is a first for branch office routers."

At a branch office, IBM Network Stations will receive boot images from the hard disk in the Access Unity.

'GREAT' CONCEPT

"The concept sounds great if it works out," said Sam Metwally, information systems director at Rainbow Apparel Co. in New York. Metwally said he is looking for a versatile remote office networking device for his remote sites, which will use IBM thin clients. Having a wealth of fea-

tures in one router "would, of course, be much easier than working with multiple boxes," he said.

The Access Unity is the preferred offering for booting network stations at remote sites, an IBM spokesman said. In the meantime, IBM has been providing flash cards to some users to perform that task. The cards can be inserted into a thin client to assist in booting up.

The all-in-one box is also the first IBM device to support features needed for VPNs, including the Layer 4 Tunneling Protocol for creating links over the Internet and IPsec encryption, which provides data security.

The Access Unity router will cost \$6,700 and will ship on Nov. 13. □

Software to link handhelds to intranet apps

By Matt Hamblen

BUSINESS USERS have been hankering for ways to get their handheld computers to provide more than just personal calendars and contact information. Now, new technology could bring the corporate in-

tranet right into users' hands.

This week, AvantGo, Inc. in San Mateo, Calif., plans to announce a server that connects iCom Corp.'s PalmPilot and Windows CE devices to corporate databases via a synchronization kiosk or wireless device without the need for a

PC in between. Server-based software will help companies administer hundreds of handheld devices and synchronize World Wide Web-based forms on company intranets tailored to fit handhelds, users and analysts said.

David Hendrie, manager of engineer-

ing automation at Consolidated Edison Company of New York, Inc., is putting the server through a trial run with 20 handhelds and plans to expand it to more than 2,000 technicians who inspect electrical lines throughout the city.

"Our technicians go out to inspect manholes, and the current plans are to use \$4,000 ruggedized devices, but I'd like to replace them with PalmPilots," Hendrie said. "Instead of carrying a spongy thing, they can slip that little PalmPilot that costs \$500 to \$500 in their pocket."

Worldwide handheld devices market

1997	3M
1998	4.0M
2001	13M

*Projected

Source: International Data Corp., Framingham, Mass.

He envisions technicians arriving each day to retrieve handhelds, which would hold new data about the workday picked up from synchronization kiosks. The handhelds would be loaded with questions pulled from a Web-based application on the Con Edison intranet such as, "Is the circuit worn?" The company would generate routine maintenance requests using the collected data.

COST-EFFECTIVE OPTION

The savings on thousands of ruggedized handhelds would more than pay for the AvantGo 2.0 server, which is priced at \$30,000 for 200 users, Hendrie said.

Another user, Chris Cawein, manager of business systems support at Federal Express Corp. in Memphis, said dozens of FedEx managers are testing AvantGo 2.0 for downloading information from the corporate intranet. They are tracking corporate information several times a day, such as how many packages were processed and how many flights were late, he said.

"This kind of software makes a PalmPilot a much more useful tool," Cawein said. The PalmPilot is already useful for calendar and contacts, he said, "but this kind of information makes it a business tool and not just a personal tool."

Analysts said the AvantGo software and future iterations of the server will play an important role in distributing corporate information.

Jill House, an analyst at International Data Corp. in Framingham, Mass., a sister company to Computerworld, said the AvantGo product will "begin to plug up a significant hole for enterprise handheld users. It will help create more enterprise applications and deployments as it makes handhelds more enterprise-friendly."

Analysis said no other software yet equals what AvantGo is providing for both the PalmPilot and Windows CE platforms, although Windows CE provides some of the same abilities.

Oracle Corp. recently announced that it is providing this capability for PalmPilot users who have access to Oracle databases. □

If your idea of real performance management is simply monitoring and reporting, have we got a flash for you.

Introducing Energizer® PME for R/3.

True performance management that identifies and resolves problems as they happen.

SAP R/3 implementation is a major step for any business. The rewards are great, but the energy consumed in R/3 performance management and maintenance can take its toll.

Maximizing your return on R/3 requires more than just monitoring and reporting on R/3 system performance. What is required is a truly proactive solution that identifies and resolves problems as they happen.

Energizer PME (Performance Management Environment) for R/3 analyzes system usage, reacts to events in real time and automatically tunes the system to improve throughput, availability and response time.

Because Energizer PME for R/3 resides within R/3 and uses standard ABAP programming features and R/3 data collection routines, it is simple to install, easy to use and overhead is less than 1%.

Four Energizer PME for R/3 components address specific needs and can be installed independently, but each form part of a logical progression that provides a high level of integration when combined.

OptiTrack identifies and alerts you to problems as they happen and allows for immediate root cause analysis. OptiWatch mon-

itors R/3, database and operating system parameters based on usage and automatically performs database maintenance.

OptiGrowth addresses capacity planning, Service Level Definition and reporting, and end to end response time reporting. OptiManage adjusts dynamic R/3 and database parameters in real time to match actual workload, ensuring maximum throughput and improved response. It also manages user resource limits and batch job execution.

Energizer PME for R/3 is the culmination of more than 15 years of experience in providing mainframe and SAP solutions that are installed at more than 1400 sites worldwide.

Find out how a real performance management solution, working in real time, can energize your SAP R/3 investment.

The leaders in new technology do it again!

ViewSonic's "Short depth" CRTs put high performance in less space.

ViewSonic® proudly introduces the PS790, the world's first 19" (18.0" viewable) short depth monitor.

The PS790 simultaneously upgrades and downsizes, providing extra screen real estate while taking up the desk space of a typical 15" (various viewable) monitor. But that's not all. A super fine 0.25 dot pitch and flicker-free resolution, as well as SuperClear™ screen technology for a brighter image, provide superb, leading-edge level of performance.

It's déjà vu all over again.

Not long ago, we introduced our first 17" (16.0" viewable) short depth monitor. The GS771 redefined sleek. Its compact footprint takes up less desktop space than a conventional 14" (various viewable) monitor. Like its space saving new PS790 sibling, the technologically innovative GS771 offers the kind of spectacular performance that runs in the family. Both of these brilliant monitors are PC and Mac® compatible. Both are in full compliance with TCO '95, the world's strictest standards for low radiation, safety, power management and recyclability. Both feature the industry's best 3 year warranty on CRT, parts and labor.

And both are available with our exclusive 48-hour Express Exchange® Service option. The space saving monitors from ViewSonic. They'll improve your short-depth perception. Again and again.

FRANKLY SPEAKING

The feds crack the code

FRANK HAYES

What if the heck is going on here? Two months ago on Wednesday, July 15, a group of encryption crackers broke one of the most widely used systems for scrambling data.

Broke it? Let's rephrase that. The government-approved 56-bit Data Encryption Standard (DES) was demolished, obliterated, blown sky-high. A team from the Electronic Freedom Foundation (EFF) built a not-very-hard-to-build computer that can crack a 56-bit DES cipher in a few days.

But that isn't what's so bewildering. What's truly shocking is that it took only nine weeks — until Wednesday, Sept. 16 — for the government to get the message and change its encryption policies.

For Washington, that's blisteringly fast — you can practically hear the tonic boom.

Last Wednesday, the U.S. Commerce Department announced that it is eliminating most export restrictions on software that includes 56-bit DES encryption. No longer will vendors have to jump through hoops to send abroad the same software — Lotus

Notes, Netscape Navigator, Microsoft Internet Explorer — they sell in the U.S.

More important, the new policy wipes out a lot of com-

It's your turn to get the message: Start encrypting — now.

plexity for IS shops of multinational corporations — or those with business partners in other countries. Now those users won't have to choose between 40-bit "international" encryption and "U.S.-only" encryption. And IS implementors

won't have to go to a non-U.S. supplier or kludge together a chunky home-brew encryption scheme.

Of course, the downside is that the newly liberated crypto is exactly the stuff the EFF crackers broke. It isn't the much-stronger 128-bit encryption that some lawmakers and hobbyists want to make freely exportable. But even wimpy, breakable 56-bit DES encryption is better than nothing. And nothing is exactly what protects most corporate data today.

And it's still stunning that, in the midst of a sex scandal, an international financial crisis and a stock-market nose-dive, Your Tax Dollars at Work managed to read the unencrypted writing on the wall and loosen the crypto rules in Internet time. Not Washington time.

Wonder exactly how that's possible?

Here's a clue: When the White House and Congress are obsessed with other things, cabinet members have a lot more flexibility to cut their own deals and make things happen. And Commerce Secretary William Daley — son of the late Richard J. Daley, boss of the infamous Chicago political machine — certainly knows how to cut a deal.

The Commerce Department has been fighting the FBI and the National Secu-

ridy Agency for years to loosen encryption restrictions. The victory this time may be small, but it sends the right message: Encryption is good business.

So it's your turn to get the message: Start encrypting — now.

Encrypt your users' e-mail. They're negotiating deals, making plans and exchanging confidential information with business partners. That's useful business intelligence to any competitor or industrial spy. Without encryption, the message can be read in seconds by anyone sniffing the network. Encrypt it.

Encrypt files on every laptop so corporate information won't be easy pickings if the machine is stolen at an airport X-ray machine. Encrypt files on desktop PCs, too, and any computer where a visitor might gain access in a few moments alone at the keyboard. Sure, it'll take time, effort and maybe some hired expertise to give your users and data a measure of security. But encryption is cheap insurance against thieves, hackers and industrial spies.

And remember, it took the federal government only two months to figure out that encryption is good business.

How long will it take you? ☐

SHORTS

HP to trim global staff

Hewlett-Packard Co. will reduce its global workforce as part of its ongoing cost-cutting efforts, but the total number of reductions hasn't been determined, a spokesman for the Palo Alto, Calif.-based company confirmed last week. Although HP won't hand out pink slips, it will use relocation and voluntary severance to reduce its staff, spokesman Brad Whitworth said.

Raytheon considers outsourcing

Raytheon Co. is considering outsourcing several of its information technology areas, including data center operations, desktop management, e-mail services and its help desk. Jim Infiguerra, vice president and chief information officer at the Lexington, Mass.-based company, said he is looking at outsourcing areas that "make sense, but we're not going to outsource major portions of IT," such as engineering. Infiguerra said Raytheon's Hughes Electronics unit outsourced all of its IT before a 1997 merger. A decision to outsource won't be made before the end of the year.

Oracle boosts Java

Oracle Corp. last week formally unveiled the latest edition of its flagship database, Oracle8i. CEO Larry Ellison declared that the industry is moving from the "dead end" of client/server computing to its "final evolutionary stage" of Internet computing, with Oracle8i as the first Internet database. The product's Java capabilities [CW, Sept. 7] should "further embed Java as an alternative programming language for developers and make it more useful to organizations," said Brian Murphy, an analyst at The Yankee Group in Boston.

Domain deal approved

Two key groups overseeing Internet issues agreed to a compromise proposal for a new international body to govern domain names and numbers. The U.S. government in June decided to relinquish control on Sept. 30. The proposal was hammered out by the Internet Assigned Numbers Authority and Network Solutions, Inc. in Herndon, Va., which holds the federal contract for registering domain names. More information is at www.iann.org/intro-coop.html or <http://netel.com/policy/icanm>.

EDS opens year 2000 database

Electronic Data Systems Corp. in Plano, Texas, last week opened up to the public a database that describes the year 2000 compliance status of 129,000 technology products from 1,400 vendors. The searchable database, located at www.eds.com/vendors2000, was previously available only to EDS customers. While House aide John Kassekin said the EDS site complements the government's push to encourage information sharing among users and vendors.

Web video to improve

RealNetworks, Inc. in Seattle is licensing technology to Intel Corp. for the next version of its RealSystem Gx software, which is due out next month. The technology, called Intel Streaming Web Video, lets sites encode live videos for Web broadcast at four speeds on a single 400-MHz Pentium III system. With current technology, four separate systems are needed. The company said Intel's technology also will boost streaming video decoding performance, improving Web video quality.

Customer: Korean Air, Seoul
Prime contractor: IBM
Turnover: \$400 million, 10 years

Highlights: The information technology outsourcing deal covers operation of all of the airline's computer systems, global network, electronic-commerce and business recovery services. The goal is to make Korean Air more competitive and improve customer service.

It's official: MCI WorldCom, Inc.

WorldCom, Inc. and MCI Communications Corp. last week officially closed their \$40 billion merger, following approval by the Federal Communications Commission. The new MCI WorldCom, Inc., based in Jackson, Miss., will offer an expanded range of data, Internet, local and international services over its infrastructure, which could lead to attractive pricing for corporate customers, analysts said.

SHORT TAKES Intergraph Corp. requested a summary judgment in its patent infringement suit against Intel Corp. regarding technology used in Pentium chips. ... A consortium of storage industry vendors has announced a next-generation version of SCSI called Ultra 160/m SCSI, which can handle 160M bytes/sec, transfer rates, or double that of its predecessor. ... Fujitsu Software Corp., in San Jose, Calif., announced the BioDisk Line of server software, which enables the wireless transmission of Internet data to pagers, phones and handheld devices. Pricing starts at \$2,495. ... Motorola Communications Corp. last week released a so-called "Windows-friendly" version of its Communicator 4.5 groupware/browser suite.

SPEED, CAPACITY, AND THE PURSUIT OF BURYING YOUR COMPETITION.

**The New Skyline II -
The fastest mainframe on the planet**

Skyline II gives you an almost unfair advantage over your rivals. And isn't that what you've been looking for? With its highly refined processing and maximum 12-way configuration, Skyline II has a capacity of more than 2.5 times that of today's high-end Skyline. Which means you'll be able to deliver the timely, efficient service your customers demand while digging a proper grave for your competition. If your goals are to please customers and harness unlimited business potential, Skyline II is your answer. For speedy details, drop by www.hds.com

Office 2000 suite opens the door to Web postings

By David Cronstein

AFTER MORE than a month in beta testing, Microsoft Corp.'s Office 2000 suite strikes users as a rich and promising tool for letting employees post information on corporate intranets and World Wide Web sites.

Documents can be posted directly to the Web server from within Microsoft Word, the suite's word-processing program.

They can also be put back into Word for editing — without the end user ever realizing that the document is in the Web's Hypertext Markup Language format.

Organizations with pen-and-pencil demand or with a zeal for the Internet will likely be the earliest customers for the suite, said

What's in Office 2000:
In beta since Aug. 10, Office 2000 will include Word, Excel, Outlook, Access and PowerPoint. A high-end version will include FrontPage. Users will be able to:

- ◆ Save and edit any Office document on a Web server
- ◆ Access and analyze back-end data
- ◆ Detect and repair problems in important system files

Mary Wardley, an analyst at International Data Corp. in Framingham, Mass., a company affiliated with Computerworld.

"Those [users] that skipped the last round will jump on this one. Those that upgraded last time may wait and see a little longer," Wardley said. "It depends a lot on where the organization is with their embrace

ing of the Web and Web technologies."

That Web publishing capability will make a big difference at the California Department of General Services in Sacramento, said Web technology engineer Jamie Mangrum. The agency is testing Office 2000 and deploying an intranet to 3,000 users.

With Office 2000, the human

resources department will be able to post job listings on the intranet on its own, for example, thus freeing the information systems department to deal with other issues, Mangrum said. Previously, the IS department had written a custom ActiveX program to simplify the task of Web posting for end users.

Mangrum said he hopes to distribute a second beta version widely and then upgrade to Office 2000 soon after it is released commercially. The suite is expected to be available early next year at a price similar to that of Office 97.

BIG SHY

Although Mangrum and other users said the suite doesn't seem buggy, Shawn Myron, a financial communications provider BCTel Mobility in Barnaby, British Columbia, said his company will wait to upgrade because it wants to be sure it isn't caught with any bugs.

Nevertheless, Myron said he welcomes the ability to post Ac-

cess and Excel reports and tables to Web servers, which will give BCTel's end users a Web front end to corporate data.

Beta testers and Office users who are less interested in Web publishing aren't as enthusiastic about the new version. Dan Joaquin, vice president of information technology architecture and engineering solutions at clothing retailer Gap, Inc. in San Francisco, said there is no compelling reason to upgrade to Office 2000 yet. □

RoboMon update helps cut staffing needs

► Version 7.0 automates disk space monitoring

By Cynthia Bourneville

IF IT DEPARTMENTS could clone their Windows NT managers, what a better world information technology would be. The latest version of RoboMon 7.0 for Windows NT, from Heroic Corp. in Newton, Mass., comes closer to achieving that fantasy by making the systems administration and management process across an entire enterprise more automatic.

But more automatic doesn't take into account unexpected problems that could occur, such as unanticipated implementations, cautioned Philip Mendoza, an analyst at Framingham, Mass.-based International Data Corp., a Computerworld sister company.

Still, the new features in RoboMon 7.0 (see chart below) will save Sunterra Resorts \$100,000 annually as it begins to deploy a new server farm. The vacation time-share company in Orlando, Fla., has an IT staff of 100. Adding more personnel to manage the 14-system server farm, which will grow to 80 servers by the end of next year, isn't part of IT's goals.

With RoboMon, "I can have 80 servers out there, and I don't have to devote one to three people more to monitor them," said Mike Westerfield, a systems engineer at Sunterra Resorts.

The company installed the predecessor to Version 7.1, RoboMon 6.4A, two months ago on the 14 servers that use Citrix Corp.'s WinFrame thin-

client server software. Westerfield said the systems have yet to crash, thanks to RoboMon's ability to notify IT managers of problems before they occur. Before installing RoboMon, Westerfield said he spent weeks troubleshooting problems on the company's Microsoft Corp. Exchange Server network, which kept crashing at 1 a.m. each day because of a process that hogged available memory.

Westerfield stumbled upon RoboMon 6.4A while surfing the Internet for software tools to support the server farm. "We thought, 'Man, we can't possibly monitor 80 servers [with a few people]," Westerfield said. He said RoboMon has reduced the three-week troubleshooting process to virtually nil.

"It's pretty much a done deal that we will upgrade to 7.0," he added.

Interleaf Corp., a company that hosts Web sites for brokers and real estate agents in Virginia, plans to reduce labor on specific tasks by using RoboMon. Interleaf relies on three IT staffers to manage a Windows NT network of 40 servers.

"RoboMon reduces the amount of manual work [we have to do], so we can work on more pressing things," said Todd Wallace, an NT systems administrator. Those functions include automatic reporting and tracking software versions. □

New features in Heroic's RoboMon 7.0

- ◆ Remote installations can be done via template, which "pushes" the software to other machines
- ◆ Dispatching rules to more automatic
- ◆ Variables that contain thresholds, such as CPU capacity, are automatic
- ◆ Drag-and-drop operations were added so changes can be sent to multiple servers

Cluster server supports 32 servers

By Nancy Dillon

WORTHAM VIEW, Calif.-based Veritas Software Corp. is trying to change users' negative perception of server clustering.

The perception is that clusters consist of two nodes with a shared disk in which half of the server resources sit idly by waiting for fail-over — a proposition that can almost double hardware costs.

32 SERVERS

But Veritas' Cluster Server, due this week, will allow the clustering of 32 servers. That means one idle server could support 31 others as a fail-over device. Or extra resources spread across a

few nodes could shore up the cluster, with users specifying the path for both initial and consecutive fail-overs.

The software also supports storage-area networks (SAN), so 32 clustered servers could connect with a storage pool through a Fibre Channel switch.

"Microsoft's Cluster Server has been positioned as the Holy Grail of continuous operations, but this is not true," said Michael Peterson, an analyst at Strategic Research Corp., a market researcher in Santa Barbara, Calif.

"At best, it will only get you to 99% availability. To get 100%, you have to pay attention to data access, data protection and dis-

aster tolerance. You do this with SANs, RAID and remote mirroring," he said.

Peterson said Veritas' new clustering software is the first to support storage on Fibre Channel SANs.

Cluster Server costs \$6,000 per Solaris node, Windows NT and HP-UX support is due next year. A Veritas product called FirstWatch is the predecessor to Cluster Server, but it supports only five nodes.

Other clustering products include Microsoft Corp.'s Cluster Server, FullTime Server from San Mateo, Calif.-based Palo Alto Software, Inc. and Stand-By Server from Orem, Utah, based Vinca Corp. □

DO YOU
HAVE A
POWER
NETWORK

NORSTAR WILL MAKE YOU FEEL A WHOLE LOT BETTER with a new line of products that allow branch, small and multisite operations to integrate voice and data within a single system. Forget the stress of coordinating equipment purchases from two different suppliers by consolidating your voice and data needs into a single, powerful Norstar system - a system that can allow you to reduce initial costs by up to 25 percent while significantly lowering day-to-day management costs. Norstar's evolving product line includes the Norstar EDM200 which enables more affordable LAN-to-WAN access by supporting voice calls and data traffic over a single T1 line. And Norstar helps transform your network into a Power Network, keeping pace with your changing needs. So, take a deep breath and call 1-800-4 NORTEL, dept. 3YDK or www.nortel.com/3YDK.

NT source code to be made available in snippets

► **Ballmer: Win NT 5.0 out in 8 to 12 months**

By David Ornstein
and Sharon Gaudin

MICROSOFT CORP. President Steve Ballmer is never going to throw the source code of Windows NT wide open, but, at the behest of developers, he plans to open Windows more than just a crack.

Specifically, Ballmer said Microsoft will weigh requests for opening specific segments of code based on whether doing so will help developers.

Although many Windows applications run smoothly on top of the operating system with nothing more than the standard application programming interfaces between them, many users said they would appreciate the option of being able to tinker with NT when necessary to hook in what Microsoft didn't anticipate.

Developers working on device drivers, security or proprietary hardware have been stymied by NT's "black-box" impenetrability. Most major commercial Unix operating systems aren't open source either.

But Peter Kapsis, vice presi-

dent at ETNY Services, Inc., a unit of Bankers Trust Co. in Jersey City, N.J., said he would like more NT code to be open so that his developers could write custom code that would hook proprietary or incompatible software into NT.

In the past, the bank has had trouble achieving the interoperability it needs.

Jim Stickney, senior software engineer at terminal emulation software maker WRQ, Inc. in Seattle, said that as a for-profit company, Microsoft isn't obligated to release source code, but doing so certainly would benefit developers. "There are definitely people who are hamstringed," he said.

DEVELOPER NEED

Kyle D. Mossman, a senior applications analyst at Alaska Airlines in Seattle, said he sees no immediate need for a more open NT. "We've never had to delve down that low," he said. "I wouldn't say it would make any difference."

Ballmer said developer need will be the criterion Microsoft uses to determine what to re-

lease. Speaking at Microsoft's Business Applications Conference in Las Vegas earlier this month, Ballmer said the technical flexibility that open source code gives developers has been the reason why initiatives such

as Netscape Communication Corp.'s release of Mozilla and IBM's embrace of the Apache Web server have become more popular. To open NT entirely, however, would be to give it away.

"Can we provide our software products for free? The answer to that is no," Ballmer told a audience of 3,000 developers. But releases of small, helpful snippets are becoming more common at Microsoft, he said. "We've done more of that than we ever have in the past. We've

looking at that more and more. I do think there really is a customer desire represented there."

And Ballmer wasn't making promises only about NT's source code last week. He also said Version 5.0 is about eight

last week's statement came from. "We're not shooting for a particular date but for a particular level of quality," Price said.

Meanwhile, Bob Herbold, Microsoft's chief operating officer, told a group of investors at a San Francisco conference that there may or may not be a third beta release even though one has been officially announced — without a release date.

Herbold also said in a different speech last week that if a third beta is released, it will likely be by the middle of next year.

Price backedpedaled from that statement, as well.

He said a third beta definitely is in the works and a release date for that is dependent on users' reaction to Beta 2 and how quickly adjustments can be made to that.

"Beta testers are just getting [Beta 2] up and running on their systems," Price said. "It really isn't possible to pick a date at this point."

Bill Peterson, an analyst at International Data Corp., a sister company to Computerworld, said he has been told that a third beta is in the works. He wouldn't guess the time frame. □

Intel announces aggressive product strategy

By April Jacobs

AMID LEGAL CHALLENGES, stiff competition and lower-than-expected demand for PCs, Intel Corp. laid out plans at its developer forum in California last week to forge ahead next year with a mix of processors aimed at a diverse and highly segmented PC market and a focus on making PCs easier to manage.

Speaking at the forum, Intel President and CEO Craig Barrett described next year as "the most intensive year for product announcements that we've seen for some time."

Intel's strategy holds promise for both corporate end users and the Santa Clara, Calif., chip maker itself, observers said.

"This is a definite, deliberate move on their part to broaden their market, because the market segmentation is growing," said Tim Thomsen, an analyst at MicroDesign Resources in Sunnyvale, Calif.

With last week's announcement, Intel is indicating that it

is moving toward offering a diverse and wide range of processors — from relatively low-cost Celerons to high-end Xeon chips aimed at power users.

The company has been moving toward that model for a few years, but it is only in the past year that it has committed to several types of chips for different markets, choosing not to

a market force, competitors carved out market share, but Intel came late with a cache-less Celeron offering this spring.

And in trying to reach its goal of becoming a high-end provider, the company has come to realize that a one-size-fits-all chip just won't do the trick, Thomsen said.

"The real benefit for users is

low-end computers and high-end workstations.

"The way chips are going to go, people are going to get the processor power specific for their application," said Larry Garden, manager of technical services at Brecken Retail, Inc. in Mississauga, Ontario. "With customized chips, you can get the power in the price range you want."

GOOD NEWS, BAD NEWS

In other words, administrative workers could get low-end PCs that would run word processing and light spreadsheet-type applications just fine, and companies could aim more dollars at high-end users' machines when necessary.

But users also point out that too much of anything isn't a good thing. Companies will still need to stick to the idea of standardizing desktops as much as possible to avoid the support is-

sues that come with having a plethora of hardware platform.

"For high-end users — those of us who need the flexibility and performance — this will be good. But giving people too many choices might not be good for the people who have to support all that," said John Delta, director of advanced technology at the Haskin Stock Market, Inc. in

Intel is moving toward offering a diverse and wide range of processors — from relatively low-cost Celerons to high-end Xeon chips aimed at power users.

Thrumbull, Conn.

The newest portion of the Intel chip lineup, code-named Katmai, is aimed at high-end users and is due in the first quarter of next year.

It was designed to offer enhanced multimedia and better performance for graphics-intensive applications.

Intel will also deliver faster 366-MHz Celeron processors with integrated cache aimed at both low-end desktops and mobile computers.

The company will bolster its Pentium III line processor lineup with a 1M-byte cache offering in the first quarter of next year. □

- Upcoming 1999 announcements from Intel:**
- **Pentium processor with MMX technology for mobile computers in first half of 1999**
 - **"Katmai"-enhanced multimedia/graphics processor due in first quarter 1999, with clock speeds of 450 MHz and 500 MHz**
 - **"Coppermine" for desktop and mobile PCs based on 0.18 micron technology due in the second half of 1999**

rely solely on the plain-Jane Pentium to be its bread and butter.

Industry observers say Intel's ignorance of the low-end market was a critical mistake. When strong sales made it apparent that the low-end PC would be

that when you develop and build products for specific applications, they perform better, and your customers can choose what they want," Thomsen said. For corporate end users, that means chips aimed at everything from mobile devices to

**"WE SPENT MILLIONS OF DOLLARS
GETTING READY FOR THE YEAR 2000.
I'M SURE WE FIXED EVERYTHING."**

"AT LEAST, I THINK WE DID."

**Introducing TouchPoint™ from
Micro Focus. A Five Times Faster Way
To Test Your Converted Code.**

Your code's all fixed, every last line of it. Nothing to worry about, right? Just in case, Micro Focus has a more accurate way to doublecheck things. We call it TouchPoint. A totally new solution that offers 5 times faster results than other Y2K black box tests¹.

You Want Accuracy. We've Got Accuracy.

To achieve faster, more accurate results, Micro Focus reinvented the Y2K test. The result is a totally new methodology called fragment testing. Fragment testing enables you to test only the code fragments that have changed before running time-consuming tests on the entire application. A solution that actually helps to enhance COBOL code quality while decreasing the time required for system testing.

Nothing Else Works Quite Like This.

TouchPoint is a Y2K testing tool that tests mainframe-based applications in an off-load environment. So you can run tests without placing demands on mainframe resources. And that can lower your costs significantly. So stop sweating over your code already. Give us a call at 1-800-632-6265 ext. 101 and take the guesswork out of getting ready for the year 2000.

SAP firms up post-R/3 plans

By Craig Stedman
LOS ANGELES

SAP AG is starting to deliver on its promise to extend beyond the realm of R/3. But don't expect it to start selling scads of software to non-R/3 users any time soon.

At SAP's Sapphire '98 user conference here last week, as expected, the spotlight was on new applications that go beyond corporate back offices (C/W Aug. 17). For example, SAP released data warehousing software, began limited shipments of a supply-chain planning package and announced plans for stand-alone marketing, sales and field service applications (see chart).

The new applications can be used apart from R/3, and SAP CEO Hasso Plattner said they have to sink or swim on their own technical merits. SAP's developers were told that products that aren't deemed to be among the top three in their categories in three years will be

PACKAGE STATUS	
Shipment plans for SAP's new applications	
PRODUCT	AVAILABILITY
Business Information Warehouse Data warehousing	New
Advanced Planner & Optimizer Supply-chain planning	Limited shipments only; general release due in December
SAP Focus Sales, marketing and field service	Limited shipments due in December
Business-to-Business Procurement Internet-based procurement	Limited shipments due in December
Logistics Execution System Warehousing and transportation management	Limited shipments due in Q4

dropped, Plattner added.

Given SAP's clout, there isn't much reason to doubt it can be successful in each of the new businesses, users and analysts at Sapphire said. But most of the interest is expected to come from companies devoted to R/3, they added. And the new products still need time to evolve.

For example, Procter & Gamble Co. worked jointly with SAP

to develop common supply-chain planning software that's scheduled to go live in January and remain in use until SAP's packaged Advanced Planner & Optimizer (APO) gets bulked up with additional demand-planning and capacity-leveling features.

Richard Clark, global process owner for demand planning at Procter & Gamble, said the

big Cincinnati-based consumer products company eventually plans to standardize all of its demand and production capacity planning on APO, replacing a mix of applications from Manugistics, Inc. and other vendors.

Procter & Gamble has 15,000 R/3 users and wants to run as much of its business on SAP software as possible, Clark said. But committing to APO "wasn't an easy decision because, from a planning perspective, the functionality isn't all there," he added.

PLANNING AHEAD

Riverwood International Corp., an Atlanta-based maker of paperboard and packaging materials for the beverage industry, plans to use APO and SAP's new Business Information Warehouse data warehousing software as part of an R/3 rollout that is due to be finished early next year.

Robert Betts, director of glob-

al information systems at Riverwood, also said APO doesn't have all the pieces needed by his planners and schedulers yet. For example, they initially will have to keep doing transportation planning manually, he said.

But initial tests of APO's demand-planning features pointed out ways of lowering inventory costs that the Manugistics software now used by Riverwood missed, Betts said. And APO is expected to help the company work with its customers to fine-tune individual demand forecasts and production plans. "That's one of the key drivers for the whole R/3 project," he said.

Bruce Richardson, an analyst at AMR Research, Inc. in Boston, said the new applications could account for up to 30% of SAP's sales in three years—with most of the money coming from users who first choose R/3.

"They're really throwing the gauntlet down in these markets," Richardson said. "But the idea that someone would want to buy that stuff to use with their Oracle applications is delusional." □

World wide watch: Surfer census

• Audience size puzzles E-commerce planners

By Sharm Mahdin

JUST HOW MANY Web surfers are out there, anyway?

Nielsen Media Research last month said there are more than 70 million Americans on the Internet. Framingham, Mass.-based International Data Corp. (IDC), in contrast, reports 58 million. IDC is a sister company to Computerworld.

For executives trying to develop budgets and business plans for their World Wide Web activities, it can be hard to nail down the size of their potential markets.

"Nobody really knows," said Teresa Krasinski, a spokeswoman for the Advertising Research Foundation in New York, whose members include major advertisers and media firms. "Right now, you can't even compare the numbers."

That's because whereas one research firm may count people 18 and older who have gone online in the past three months, another may target 16-and-older Web users who surf every week.

Numbers can differ because of methodology as well. IDC,

for example, blends its survey data with industry information about PC and modem penetration to come up with its estimate; many other firms rely on random survey data alone.

The Advertising Research Foundation has established a group aimed at helping Web watchers compare apples to apples, so advertisers can get a better idea of how many people they are actually reaching—and thus what rates are fair. The group hopes to coax various rating agencies into publishing at least one standard statistic: Americans in the 48 contiguous states, 18 and older, who have used the Web in the past 30 days. Several have already agreed, and the group's next meeting is Sept. 29.

And one company, EMarketer in New York, hopes to cash in on the confusion, offering its own numbers that it said are an analysis of various other Internet forecasts.

EMarketer "statmasters" Geoffrey Ramsey said he believes that many Web estimates are overly optimistic. "They tend to include everybody who was ever

on the Internet," he said. "We eliminate dabbles and drop-outs." Another problem? Some people surveyed are embarrassed to say they aren't plugged in. "It's like saying, 'I've had my head in the sand for the last six years,'" he said. EMarketer estimates that there are 47.6 million Americans online.

Companies developing Web business plans typically start with the total available audience and then focus in on the demographics they are looking at. "You start building up the model," Ramsey said. "It needs to be built on decent numbers."

GOOD BET

But CommerceNet spokesman Loei McPhee said the Nielsen study used a reasonable definition to come up with 70.5 million people online: Americans 16 or older who were online at least once in the past month and still have Internet access, determined from random phone calls to 4,000 to 7,000 households per quarter.

CommerceNet, an e-commerce industry education and lobbying group, jointly conducted the Nielsen study.

Companies on the Internet

HOW MANY OF US ARE ONLINE?

COMPANY	LATEST ESTIMATE OF AMERICANS ONLINE (ANNUALLY Q2)
Cyber Dialogue, Inc. New York	53.5M "active and current users" (self-defined, adults 18+)
EMarketer New York	47.6M adults (16+)
Forrester Research, Inc., Cambridge, Mass.	51M adults (12+); based on 120,000 responses to mailed survey
InterQuest Information Group, Inc. Austin, Texas	67.5M adults (16+); based on at least once in the past 90 days; sample size of 3,500 households
International Data Corp., Framingham, Mass.	58.2M Internet users, 46.7M Web users; based on multiple surveys and analysis of industry data
Jupiter Communications, Inc., New York	59.5M Americans on the Web; based on survey of 50,000 people
NetRatings, Inc., San Jose, Calif.	43.1M home Web users; based on 10,000 people called, 2,000 interviewed
Nielsen Media Research New York	70.5M adults (16+) used the Internet in the past month and still have access; based on 4,000 to 7,000 people surveyed per quarter

may not want to ignore the dabbles, said Tom Fornoff, an analyst at InterQuest Information Group, Inc. in Austin, Texas.

Once "window-shoppers" can be enticed to begin buying online, he said, many end up spending a lot of money. "Do you ignore them, or work on a program to ripen that market?" he said.

But some companies that hope to sell goods to consumers on the Internet now may want to look not at the total Web universe but instead at those who are most plugged in.

According to InterQuest, the most active 17 million Americans account for 68% of all activity online. The least active 17 million? Just 3%. □

**"Our customers were on the Web.
Our data was on the mainframe."**

Our solution was WebFOCUS."

Users plan for policy network pluses

By Bob Waller

USERS ARE welcoming the arrival of policy networking with open arms because it provides greater control of network bandwidth and security features that have been long-awaited.

As a result, the four major interworking vendors — Cisco Systems Inc., 3Com Corp., Bay Networks, Inc. and Cabletron Systems, Inc. — are offering it with new switches. Cisco recently debuted a system with support for its version of the emerging network scheme.

Policy networking represents a major change in how users run their networks.

"It will enable you to manage your network environment as a resource instead of as a group of individual devices," said Jim Hutchinson, network manager at Children's Hospital in

Insurance Holdings of America CIO Jim Barry says "policy networking aids security"

Boston. "It'll be networking nirvana." With policy networking, IS managers can prioritize traffic by application to ensure that

critical ones get the bandwidth they need when networks become congested.

"Policy networking will let us give top priority to our mission-critical enterprise resource planning traffic, so that an unimportant file transfer doesn't stomp all over our SAP transactions," said Eric Pytko, global infrastructure coordinator at Eastman Kodak Corp. in Rochester, N.Y. "It will prevent that problem on our slower WAN links where bandwidth is limited and expensive."

Information systems managers create policies, which are instructions on how to apportion bandwidth and what resources users can access. The

policies are then sent to dedicated distributed servers for logging and are relayed to switches and routers in the network, which execute them when needed. "Having to go out and [make changes] to every WAN router represents a significant cost in manpower," Pytko said.

Policy networking, through directory services, also gives users greater flexibility and lets network administrators tighten security.

"It'll be able to create policies that define access to network resources on a per-user basis, which will be a big benefit because today it's almost an all-or-nothing situation," Hutchinson said. "Security is a huge concern because of distributed computing and mobile workers." Employees will be able to connect to the network anywhere and receive access to the

same network resources, he added.

The fact that some of the four major interworking vendors has delivered all the components that are needed for policy networking isn't stopping one user from moving forward.

"We're deploying policy networking to efficiently deliver video from kiosks and [consumer] PCs to the desktop of our call center agents for the first time," said Jim Barry, chief information officer at Insurance Holdings of America LLC in Beverly, Mass. "We realized that if we didn't manage how our bandwidth was being allocated, the responsiveness of other applications would be in jeopardy."

As yet there is no interoperability among the schemes, which would present problems only to multivendor shops, said John Armstrong, an analyst at Dataquest in San Jose, Calif. "It's not in the vendors' best interest. And I'm not aware of an effort to address this." □

XML finding a place in Web procurement

By Cynthia Bourneles

BUSINESSES ARE starting to look to XML to reduce procurement costs when buying indirect goods over the Internet.

"Two companies have joined forces in an attempt to lead

Charm Solution. That product includes BuySite, a program that automates the procurement process from request to order, and MarketSite, software that automates supplier interactions from order placement to payment. Commerce One said

XML to Commerce One products should bring the county closer to its procurement-savings goals. Because of XML's ability to define products, buyers can quickly identify the right products at the right price through suppliers' online catalogs. The county, which expects to have the Commerce One product running by October, spends \$70 million annually on goods for many sectors, ranging from health care to highways. The CAMIS project aims to reduce inventories, which Varney said can be as high as 17% per item.

Online catalogs are the first applications taking advantage of XML. "XML gives buyers access to a common ground," said Mary Laplante, an analyst at Fastwater LLP, a Pittsburgh consultancy. Because XML gives definition to text products can be categorized, which helps buyers when searching online.

Scott McCormick, a project manager at Pacific Gas & Electric Co. in San Francisco, is working on a catalog system that will integrate a BuySite add-on product called Multi-Supplier Catalog into an SAP AG purchasing application designed to contain six supplier catalogs, each holding between 7,000 and 8,000 items, by the end of next year. The goal is to reduce the potential for errors. For example, suppliers sometimes "describe the same products in different ways," McCormick said. □

Year 2000 bill would encourage data sharing

By Matt Hamilton

THE YEAR 2000 Information and Readiness Disclosure Act unanimously passed the Senate Judiciary Committee last week and is expected to move quickly to the full Senate.

The bill (S. 2392) encourages the exchange of technical information among companies for solving year 2000 problems and preparing contingency plans. In the revision passed by the committee, companies don't avoid liability for selling products that don't work.

Sen. Robert Bennett (R-Utah), chairman of the Senate Committee on the Year 2000 Technology Problem, introduced the original measure in July and endorsed the substitute bill drafted by senators Orrin Hatch (R-Utah), chairman of the Judiciary Committee, and Patrick Leahy (D-Vt.), the ranking Democrat on the committee. "This legislative compromise is essential to the continued economic well-being and security of our nation," Bennett said.

The National Association of Manufacturers, a group of 40 business associations, immediately backed the revised bill. "We need immediate legislative action to help get the country

ready for the year 2000," said Jerry Jasnowski, the association's president. "The Hatch/Leahy bill will improve Y2K readiness by addressing many industry concerns about liability and antitrust protection."

In the measure, information sharing is encouraged because incorrect year 2000 statements would be protected from liability — as would the persons who make the statements — unless a plaintiff in a lawsuit can prove that information was deliberately false or provided recklessly or with the intent to deceive.

The protected statements don't include filings about readiness with the Securities Exchange Commission or banking regulators.

An addition protects the confidentiality of voluntary industry or economic sector information provided to the federal government. The government won't release such information without the approval of the company that gave it, the senators said.

A bipartisan coalition of senators and the chairman of the President's Council on Year 2000 Conversion endorsed the substitute version, which the committee passed by an 18-0 vote on Thursday. □

The Power to Manage. Anything. Anywhere.™

IT MANAGEMENT *meets* BUSINESS MANAGEMENT.

Introducing Tivoli Enterprise

IT management isn't just about running your networks, systems and applications. It's also about running your business. It's about providing each of your departments with the level of service it needs. It's about making sure orders can be received, products shipped and sales tracked. And it's about doing business on a global scale and a 24-hour clock.

Tivoli Enterprise™ is the latest release of our enterprise management software. It's designed to bring a business focus to managing today's complex, multiplatform environments. Mainframes and servers. Laptops and PCs by the thousands. Databases. Critical apps. Tivoli Enterprise helps manage all of them.

Tivoli Enterprise is easier

How much more productive could you be if all your hardware and software came ready to manage? That's the idea behind Tivoli Enterprise. It's why a large and growing number of companies like Intel, 3Com and IBM design their products to be Tivoli Ready™ from the word go. At its heart is our One-Touch Management™ architecture that makes deploying Tivoli Enterprise, in a word, easier.

Tivoli Enterprise is smart

Setting IT priorities means that mission-critical problems can be handled before less-than-critical ones. Automated decision support, built into Tivoli Enterprise, allows for just that. Your IT resources can be used more strategically and efficiently. So you can optimize service levels and meet business goals.

Tivoli Enterprise is here

Right now, Tivoli Enterprise is being used successfully by leading companies like Ford, Reuters and USAA. A worldwide network of service providers and the global support of IBM can help you get started right away. That's the power of Tivoli Systems Inc. To see how Tivoli Enterprise can help you meet your business goals, go to www.tivoli.com or call 1 888 TIVOLI-1.

Tivoli is a registered trademark. Tivoli Enterprise, Tivoli Ready and One-Touch Management are trademarks and One-Touch is a service mark of Tivoli Systems Inc. in the U.S. and/or other countries. In Germany, Tivoli is a trademark owned by Tivoli Systems GmbH. Tivoli Systems Inc. is an IBM company. IBM is a trademark of International Business Machines Corporation in the U.S. and/or other countries. IBM is a registered trademark in other countries. Other company product and service names may be the trademarks or service marks of others. © 2000 Tivoli Systems Inc.

Middleware tools link business applications

By Robert L. Scherer

TWO COMPANIES are offering a new option for users who need to link business applications such as those from SAP AG or J. D. Edwards & Co. using message-oriented middleware.

Oboron Software, Inc. in Cambridge, Mass., last week announced that it has licensed its Prospero application-integration software tools to Englewood, Colo.-based New Era of Networks, Inc. (Neon) to resell along with Neon's own MQIntegrator. The combined tool set will let

Neon extend IBM's MQSeries message-oriented middleware to increasingly popular business applications.

Message-oriented middleware is software that allows applications that run on different platforms to share data without having to be in constant communication.

Such application-linking capability could help Blue Cross/Blue Shield of Rhode Island improve customer service, said George Trudel, business and technology office consultant at the Providence health insurer.

"We are... looking at moving toward capturing a lot of the procedural and policy information in Lotus Notes, and we need to link that into a transactional database which resides on the other side of MQSeries," Trudel said.

It's déjà vu all over again: The new COBOL.

It's not your father's COBOL any more.

If you're still thinking of COBOL as the "green screen machine," wait till you see what's being done around the world with ACUCOBOL-GT.

And if you've been thinking of enhancing your COBOL applications, you'll find you can do it best without even thinking about C/C++ or VB, and can make incredible strides without changing a line of your current application code.

Want a modern GUI?

Just add it to your existing applications with our ACUCOBOL-GT WYSIWYG screen painter, using the same "widgets" you find in VB and other front-ends.

Web publishing?

It's easiest with ACUCOBOL-GT.

Just add a hyperlink to your application or embed it in your page, then have your clients install our plug-in for their Netscape or Microsoft browser and we're done.

Relational DBMS access?

Utterly seamless with Acq4GL™. It executes COBOL I/O operations by invisibly generating SQL to get the answers you need, and supports identical source code across hardware platforms and RDBMSs including Oracle, Informix, Sybase and SQL Server.

Cross-platform capabilities?

We were cross-platform when Java was still a bean, and today ACUCOBOL-GT runs applications unchanged on over 600 UNIX and Windows platforms.

Which all adds up to the fact that you can enhance your users' interaction while reusing code you know is reliable because it's been running for years — your COBOL code, the ultimate reusable resource. Everyone from your maintenance staff to your CEO will love it.

There's more, so check out the details on our Web site or call today and let us give you the whole story.

It's the new COBOL. ACUCOBOL-GT.

ACUCORP

(800) 262-6585/(619) 669-4450

<http://www.acucorp.com>

theNewCobol@acucorp.com

Acucorp, ACUCOBOL, Acq4GL, Acq4GLC are trademarks of Acucorp, Inc. Other products and services mentioned are not. © Acucorp, Inc. 1998

Ben & Jerry's
Homemade, Inc.
found that the
real scoop on

cross-platform compatibility isn't java, it's ACUCOBOL-GT. They moved 460 programs and 1,000 screen components from a Novell Network on PCs to a new computer over a week-end. ACUCOBOL-GT was the clear choice because it runs on over 600 platforms.

Coffee Ole? anyone?

Before products like this came out, people were doing [application integration] piecemeal.

Jeanne Fournier, Aberdeen

Bringing together both sets of information on a customer service representative's PC would get answers to customers' questions more quickly and accurately. But Trudel said such integration hasn't yet been a top priority and that it is too soon to tell how attractive the Oboron/Neon approach might be for achieving it.

BUILT-IN LOGIC

Prospero is a suite of tools that includes prebuilt interfaces designed to take into account how the receiving application works. It has built-in logic that makes it easier to exchange data with business applications such as SAP, said Oboron President and CEO Joe Chappell. Neon's MQIntegrator does much the same with MQSeries, he said.

The companies said they expect to begin shipping adapters to link MQSeries with J. D. Edwards, Siebel and Lotus Notes early in the fourth quarter.

"Before products like this came out, people were doing [application integration] piecemeal," said Jeanne Fournier, a senior analyst at Aberdeen Group, Inc. in Boston. "What these products are trying to do is to alleviate a lot of the manual work."

Neon's MQIntegrator makes the integration easier by translating an MQSeries message into a form that a business application such as SAP can understand, Fournier said.

Chappell said it costs on average about \$100,000 to integrate a J. D. Edwards installation with another application using the tools. □

Because Central Control is the Only Virus Control.

You want an OS that's secure and manageable. Your users want an OS that's fast and reliable.

Specify Windows NT Workstation on your new PCs and everybody's happy.

It's no secret that we've just launched a great new operating system, Windows[®] 98. However, Windows 98 is optimized for home use. In most cases, Microsoft[®] Windows NT[®] Workstation 4.0 is the right OS for your new business PCs. Here's why:

Windows NT Workstation is designed to be more manageable. So it's easy to configure PCs to match user needs, from dialed up to locked down. And, when you lock it down, your administration costs drop.

Windows NT Workstation is more reliable, because it allocates separate memory space for each app. So if one app goes down, the rest stay up. Which means Bob in marketing won't be calling you today to tell you he's done it again.

Windows NT Workstation gives you better security options. Your data stays yours. Your users get access to what they need (and only what they need).

Windows NT Workstation is 26%^{*} faster than Windows 98 (it's also faster than Windows 95, for that matter). So everybody, including you, gets more done.

Windows NT Workstation is the right OS for all of your business users. So when you buy new business PCs, be sure to order them with Windows NT Workstation.

*Performance testing conducted by Venturer Software Testing Laboratories, Inc. (VSTL) on June 1, 1998, using Windows NT 4.0 Workstation 4.0 (Service Pack 1) versus a variety of computers with 32 and 64 megabytes of memory. Tests performed independently by VSTL, without independent verification by VSTL. Data based on representations or warranties. Windows is a registered trademark or trademark of Microsoft Corporation in the U.S. and other countries.

New notebooks come loaded with Windows NT Workstation.

More happy people.

Today's notebooks are ready for Microsoft® Windows NT® Workstation 4.0. In fact, many have it preinstalled and preconfigured.

Compaq, Dell, HP, IBM, Micron, NEC and Toshiba make these notebooks with great power management and PC-card swapping features. Furthermore, they make a wide range of Windows NT Workstation notebooks. So you're likely to find one that meets your users' needs, and your budget.

You know Windows NT Workstation is the right OS for business because it's more manageable, more reliable, and faster. And now you know that Windows NT Workstation will run as well on your notebooks as on your desktops.

The result: one OS, the business OS, on all of your new PCs.

Windows NT
Workstation 4.0

Linux

DEFINITION: Linux (pronounced "lin-ucks") is an open-source, multitasking, Unix-like operating system. Multitasking allows Linux to run many programs at one time. The phrase "open source" means that Linux's source code is available free. Users can download the latest version from the Internet (www.ssc.com/linux/apps/ftp.html) or purchase the software on CDs, along with printed documentation and support, from vendors such as Red Hat Software, Inc. and Caldera, Inc.

Good (and bad) news: No one owns it

By Howard Millman

In 1991, Linus Torvalds, a graduate student at Finland's University of Helsinki, wanted an alternative to DOS and Windows.

So he wrote his own version of Unix. In 1994, he released Linux 1.0. Since then, Linux has become one of the fastest-growing operating systems. The number of Linux users has almost doubled annually from 500,000 in 1994 to about 7 million this year.

The primary attraction of Linux is that it's open-source software, which means users can modify it to meet their needs without paying a licensing fee.

But there can still be a price tag involved with Linux. Pricing is based on services and support that are bundled with the operating system. Red Hat Software, Inc. and Caldera, Inc., the two major U.S. Linux players, sell the operating system, documentation, 60-to-90-day support and tools and applications. A multuser version of Caldera's Linux sells for \$199. A similar configuration of Microsoft Corp.'s Windows NT costs about \$1,300.

Another reason for Linux's appeal is it runs on many platforms including older PCs with 386/x86 CPUs, Apple Computer, Inc.'s Macintosh, Sun Microsystems, Inc.'s SPARC and iCom Corp.'s PalmPilot.

Linux's other strengths include its stability, which makes it suitable as a server operating system for manufacturing and financial applications. Its high performance makes it especially suitable for multimedia — Linux gener-

ated the spectacular special effects for the movie *Titanic*.

Linux also spawns camaraderie among programmers. For example, if a programmer discovers a defect in the code, he fixes it and shares the patch with others. Thus Linux gets improved continuously.

Linux could be an alternative to Windows in many organizations, according to Bill Peterson, an analyst at Framingham, Mass.-based International Data Corp., which is a sister company to Computerworld.

According to a survey by Dataquest, a market research firm in San Jose, Calif., the number of companies using Linux increased 27% last year. Linux and Windows NT are the only enterprise-class operating systems whose market share is growing.

But not everyone is optimistic about Linux. Ted Schaefer, an analyst at Forrester Research, Inc. in Cambridge, Mass., says he doesn't expect larger firms to adopt Linux.

Ironically, Linux's biggest benefit, the fact that no one owns it, is also its biggest drawback: Chief information officers want someone to be responsible for Linux, Peterson says.

Bottom line: If Linux is going to stay around, it will need applications to run on it. "Applications drive operating system sales," Peterson says. "The more quality applications available on Linux, the easier it is to sell Linux." □

GLOSSARY

— A complete implementation of the Linux operating system. It includes the tools needed to modify it.

— The heart of the operating system. It manages memory, files and allocates hardware resources.

— Short for "manual pages," Documentation for Linux.

— Software that is freely available and can be read, modified and redistributed. For example, the kernel and other operating system devices are open so developers can write to them and share them with others.

— Program instructions in the original form.

— A multitier, multitasking operating system for workstations. It was meant to be used only by programmers and was one of the first operating systems written in C.

Linux Torvalds personally chose this penguin because it looks content — what Torvalds believes Linux users are.

OPINION

Name game

Host: "Welcome to Name That Buzzword, the game show that matches new high-tech terms to the old technology concepts they described. Our contestants are ready, so let's begin."

"This buzzword describes a large computer that runs mission-critical corporate applications very quickly."

Buzz!

Contestant No. 1: "Is it a mainframe?"

Host: "Oh no! We're talking about an Intel cluster server. That's a concept dreamed up by PC makers to compensate for the fact that their desktop products are about as differentiated as sponges today."

"On to our next buzzword. This describes a midsize computer that acts as a front end to a variety of corporate hosts, database servers and other back-office systems. It's one of the hottest new markets in the industry. IDC expects it to triple in size to a billion dollars by

2000." **Buzz!**

Contestant No. 2: "Is it a minicomputer?"

Host: "Enter the '90s, Contestant No. 2! We're talking about an 'application server.' With Netscape, Oracle, IBM, MetDynamics,

Imprime and others signed on, how can this not be a great new market? Bad luck.

"Question No. 3: Who's got the time and people to maintain all your own financial applications anymore? This revolutionary concept puts these applications on an off-site computer and lets users get at them through the convenience of their Web browser for a fee." **Buzz!**

Contestant No. 1: "I got it! It's time-sharing!"

Host: "Wrong! It's a brand-new concept called 'application rental,' and Forrester thinks it'll be a \$6.4 billion market by 2001."

"Final category. This buzzword is, quite simply, the future of the desktop. Used to access information from a computer on a network, it presents information one screen at a time for browsing and data entry." **Buzz!**

Contestant No. 1: "It's a 3270 terminal!"

Host: "No, it's a browser, No. 1. And it'll cause thousands of IT organizations to throw out their client/server investments over the next few years."

"Too bad, contestants. No winners this time. But be sure to join us next week when we'll talk about programming. Is it an object or a subroutine? We'll find out next week on Name That Buzzword!"

LETTERS

Column's recognition of Jobs' efforts is much appreciated

Apple turnaround is a Jobs well done

Bill Laberis

I can count on one hand — without affecting my typing speed — the number of times I've praised a computer industry executive in an open forum. The word, the IT community owes a debt of gratitude to Apple's successful and shrewd CEO, Steve Jobs.

Mac is a wake-up call to the sleepy PC industry, and the mercurial Jobs deserves credit.

When competition and innovation are the only way to survive, the only way to win is to be different.

I THOUGHT Bill Laberis' column on Apple and Steve Jobs ("Apple turnaround is a Jobs well done," CW, Aug. 24) was great, but I must point out the grievous error in the following sentence:

"Sculley was succeeded by the hapless, bumbling Gil Amelio, who appeared to personally drive the final nail into Apple's coffin — never mind its apostle of a memoir or his claim that the company's present resurgence is a result of an Amelio grand plan."

Although I think that Amelio was the wrong man for the job, at least he did something. Sculley was actually succeeded by the hapless and bumbling Michael Spindler, upon whom it may be argued lies the blame for Apple's darkest days.

Nice article. Keep up the good work.

SINCE I've already said my thanks to Steve Jobs for his work as "interim" CEO, I wanted to say thanks to Bill Laberis for such a thoughtful and balanced column. Rather than harp on the "Apple isn't out of the woods yet" line, you focused on what the company is doing right now — and doing well — and you rightly credited Jobs for that.

Curtis Michelson
Orlando, Fla.
curtism@gsd.net

JUST READ Bill Laberis' column on Steve Jobs and, I must say, he gets it.

I have consistently thanked Steve Jobs for his tireless efforts and amazing accomplishments. Now it's time to thank Laberis for recognizing them and having the courage to write about them.

upgrade Charles Bailey's Ethernet backbone to Gigabit Ethernet speed.

David Stone, IS manager for the combined firm, now known as Fide. Bailly, was anticipating, among other things, intense growth in a number of insurance/extranet applications. The firm plans to deploy an IP-based video-conferencing application in the next two years. Other plans include developing an extranet application that would allow customers to file their debt and credit information electronically, eliminating the once-elusive, semi, in which customers show up at their accountant's office with a checkbook full of receipts.

The new network, completed in mid-June, brings 100M bit/sec. power

all the way to the desktop, according to Stone. Inside Bally, employees use that power to link up to a company intranet that gives them access to policies and procedures, a document repository containing frequently used accounting forms, project schedules and a bi-weekly company newsletter.

But bottlenecks still occur sometimes at the main file-and-print server as it struggles to handle the traffic coming in through the wide open network pipes. The problem, Stone says, is that with everyone communicating with the server at such high speeds, the server can't keep up. While the delays — when they occur — last just a few seconds, it's long enough to bother Stone.

"We've created these grant roads to get to the ballpark but people can't get

in because the doors are too small," he says.

As a short-term solution, Stone is in the process of installing several 100M bit/sec. Ethernet network interface cards in the server. He says he eventually plans to install a Gigabit Ethernet interface but only when he believes they have been tested enough in the marketplace to be proved reliable.

"There are a couple of cards out there, but they're not ready for prime time," he says. "I'm going to let some other people bleed on it before I put it in my pocket."

BANDWIDTH HOGS

At businesses around the country, network infrastructures can be described in two ways. At many firms, the bat-

It's Academic:

It's Academic: Ohio State University's Fisher College of Business began Phase 1 of its network upgrade from 100M bps, segments to Gigabit Ethernet and High-Speed Layer 3 switches this summer. The college plans to upgrade to higher-density Layer 3 Gigabit Ethernet switches next summer. Fisher went with Gigabit Ethernet because of functionality, price and class of service and Layer 3 Gigabit Ethernet switches for IP multicasting and filtering, says Keith Lindemann, network analyst. Below is a diagram of what the completed network will look like.

INFRASTRUCTURE

Continued from page 1
upgrade Charles Baily's Ethernet backbone to Gigabit Ethernet speed.

David Stone, IS manager for the combined firm, now known as Eide Baily, was anticipating, among other things, intense growth in a number of intranet/extranet applications. The firm plans to deploy an IP-based video-conferencing application in the next two years. Other plans include developing an extranet application that would allow customers to file their debt and credit information electronically, eliminating the once classic scene in which customers show up at their accountant's office with a shoebox full of receipts.

The new network, completed in mid-June, brings 100M bit/sec. power

all the way to the desktop, according to Stone. Eide Baily employees use that power to link up to a company intranet that gives them access to policies and procedures, a document repository containing frequently used accounting forms, project schedules and a bi-weekly company newsletter.

But bottlenecks still occur sometimes at the main file-and-print server as it struggles to handle the traffic coming in through the wide open network pipes. The problem, Stone says, is that with everyone communicating with the server at such high speeds, the server can't keep up. While the delays — when they occur — last just a few seconds, it's long enough to bother Stone.

"We've created these giant roads to get to the ballpark but people can't get

in because the doors are too small," he says.

As a short-term solution, Stone is in the process of installing several 100M bit/sec. Ethernet network interface cards in the server. He says he eventually plans to install a Gigabit Ethernet interface but only when he believes they have been tested enough in the marketplace to be proved reliable.

"There are a couple of cards out there, but they're not ready for prime time," he says. "I'm going to let some other people bleed on it before I put it in my server."

BANDWIDTH HOBS

At businesses around the country, network infrastructures can be described in two ways. At many firms, the bat-

teries of networking hardware and software already are under siege, nearly buckling under the weight of the demands from an ever-increasing phalanx of bandwidth-hogging intranet applications that threaten to suck up new capacity as fast as it can be added. Among the most voracious are video-streaming technologies that are in demand in industries ranging from education to financial services. And if firms are not yet struggling with how to supply bandwidth for these and other applications, they hardly can be smug. Like Eide Bully, they know that before long they too will be in the same position.

All this comes at a time when more and more firms are seeing that state-of-the-art networks can give them a hefty advantage over their competition. Some of the advantages: better contacts with suppliers, improved customer relationships and lower costs. With the CEO paying closer attention than ever to the CIO, and the CIO rying his company's fortunes to the intranet, the stakes have never been higher.

At the same time, the challenges have never been more difficult. Rapid application development has sharply curtailed the time it takes to develop new programs, giving network managers far less time to meet the demand when new tools come online. Particularly threatening are the off-the-shelf, IP-based audio and video applications already favored by an increasing number of healthcare, government and educational organizations and now attracting the interest of financial services firms, among others.

"Most network managers realize that even if these things are not on their networks today, they are going to be soon whether they put the infrastructure in or not," says Melinda LeBaron, research director at Gartner Group, Inc. in Stamford, Conn.

Some consultants — though not LeBaron — tout buckets of bandwidth as the one-size-fits-all solution.

Tom Nolle, a networking analyst and president of CIMI Corp., a consulting firm in Voorhees, N.J., for instance, says that more and more companies are opting to oversupply bandwidth rather than tightly manage their networks. The reason, he says, is that in the past year the price of purchasing additional bandwidth from companies, such as Bay Networks, Inc. and 3Com Corp. has dropped considerably to the point where it is now about \$100 per port.

"Why screw around with Layer 3 switching and Layer 2 switching when the problem is bits?" Nolle asks. "The truth of the matter is that in today's marketplace there is no reason why any user would want to adopt any strategy for LAN building other than to oversupply with bandwidth."

Pethaps, but others say that Eide Helmeck's tie-ups at the server demonstrate what Stone and other network managers already know: Complex problems rarely have simple solutions.

Solutions, however, are what network managers are looking for. For some the answer is Gigabit Ethernet, while for others it's ATM. While some firms are opting for complex management tools to carefully monitor and direct the flow of voice, data and video, others are simply widening the pipes enough to obviate the need for tight network management.

Short-term solutions include load balancing — the re-routing of network traffic around the busiest servers — and caching, which involves putting frequently requested pages in RAM on local servers.

BANDWIDTH IN ABUNDANCE

Niraj Patel, the CIO at GMAC Commercial Mortgage Corp. was worried as he watched the Horsham, Penn., firm grow from 54 employees in one

**"WE WANT TO OO
low maintenance
and low management.
We just want the
network to run itself."**

NIRAJ PATEL
GMAC

office in 1994 to more than 1,200 people spread out across 42 branch offices today. The firm started with a switched Ethernet network with 10M bit/sec. at the desktop scaling up to 100M bit/sec.

Earlier this year, network utilization was averaging only about 6%. Still, Patel says, customer service representatives at the loan servicing firm were experiencing delays at peak hours of a second or more as they switched from screen to screen in a commercial loan servicing application. Worse, a document imaging program from Optika Imaging Systems, Inc. took five minutes or more to create an image, a problem that was improved considerably when the proprietary client was replaced with a Web browser.

Fine-tuning network interface cards helped create some efficiencies, accord-

INFRASTRUCTURE

Continued from page 3
ing to Patel. But he says that the addition of more and more applications, many of them intranet-based, combined with growth in the number of users simply was using up too much bandwidth. With more intranet applications on the way, the company simply stepped up to a Gigabit Ethernet backbone, dropping average utilization to about 2% (see case study, Intranets, November 1997 http://www.computerworld.com/home/online/9697_nsl/all/970922intra_proj).

"A YEAR AGO I would have thought that ATM was going to be the de facto standard. Now Gigabit Ethernet looks like it has the potential to have much greater market-share."

BERNIE D. NEEL
PRUDENTIAL

Patel says the excess bandwidth will soon be chewed up by a variety of database-intensive, Web-based applications currently under development. Among them are a survey application that will allow the human resources department to question employees about a variety of topics and develop online reports. In the next few months, employees also will be able to track inventory, file expense reports and request loan checks through several new self-service applications under development.

With all of those applications expected to be jockeying for space on the network, he decided the best choice was

simply to over-supply bandwidth.

"We want to do low maintenance and low management," Patel says. "We just want the network to run itself."

NO SUBSTITUTE FOR MANAGEMENT

But Gartner's LeBaron says that solving infrastructure problems is not nearly so simple. As Edie Bailly's Stone found out, widening the pipes can simply push the problem onto a different point on the network — for example, the I/O interface.

"The problem is that most servers can't put out a gigabit," LeBaron says. "Maybe they can put out about 400M bit/sec. So if the server becomes a bot-

tlebottleneck to students online and creates chat rooms for online office hours.

Network utilization dropped from upwards of 60% to 70% down to about 20% or so, but the problems haven't been eliminated.

"It used to be that the network was the bottleneck," says Kurtis Lindemann, a network analyst at the college. "Now the server is the bottleneck."

In the case of a trio of computer labs that previously had relied on a single Compaq Computer Corp. server, the school simply gave each lab its own Dell Computer Corp. servers. In other cases, Lindemann's team added disk arrays to several servers that are in high demand.

"You really have to architect the server to put out the bandwidth," says Lindemann. "You have to have RAID arrays or fiber channel arrays that can do a lot of intensive I/O."

When it comes to management some users have shied away from ATM because of its perceived complexity. But Gartner's LeBaron says that things have changed in the last couple of years.

"There has been a lot put in place that makes ATM simpler," she says. "There are much easier to use interfaces for configuring troubleshooting tools, for example."

At least one firm wasn't yet convinced that ATM was ready for prime time. But rather than upgrade to Gigabit Ethernet, the Prudential Insurance Company of America, Inc. has instead deferred the decision, waiting to see if one of the paradigms comes to dominate the marketplace in the next few years.

In other words, management is important in any environment.

The network managers at Ohio State University's Fisher College of Business learned that lesson when they began upgrading the infrastructure from shared 10M bit/sec. segments to Gigabit Ethernet at the beginning of July. Among other things, they were facing an increase in use of WebCT, an intranet application developed at the University of British Columbia in Vancouver that allows faculty members to get course

materials to students online and creates chat rooms for online office hours. But rather than upgrade to Gigabit Ethernet, the Prudential Insurance Company of America, Inc. has instead deferred the decision, waiting to see if one of the paradigms comes to dominate the marketplace in the next few years.

Prudential began a multimillion dollar upgrade of its corporatewide network in early 1997. On the LAN level, the firm moved from collapsed Token Ring to a switched Ethernet network with 10M bit/sec. at the desktop scaling up to a 100M bit/sec. backbone.

Among other things, Prudential was facing intense growth in intranet applications. The company built an intranet

on top of Lotus Development Corp.'s Notes that now boasts more than two dozen applications. Employees can register for training courses after viewing an online catalog of offerings, receive travel vouchers and even reserve parking spaces at their site. Bernie O'Neill, vice president of distributed computing and networking for Prudential, says that the company built up the network only as much as it needed to, giving itself enough bandwidth for the present while avoiding the temptation to lock in with one technology.

"We've implanted switched Ethernet as a stepping stone," says O'Neill. "We'll either scale that to higher speed or ATM or Gigabit Ethernet. All we would have to do is take out the 100MB bit/sec. Ethernet (network interface)

cards and put in cards for ATM or Gigabit Ethernet."

Which way Prudential will go, says O'Neill, depends on cost and which approach might offer the best scalability down the road.

"A year ago I would have thought that ATM was going to be the de facto standard," he says. "Now Gigabit Ethernet looks like it has the potential to have much greater market share, which means more products will be available. We're in a good position to sit back on this one until we have to make a business decision."

ATM ADVOCATE

The University of Kentucky, for one, already cast its vote for ATM and has found that the advantages far outweigh

the issues of complexity as it races to deliver video to the desktops of students and faculty to both aid in research and to supplement other course materials.

The Lexington school began building an ATM network three years ago before Gigabit Ethernet was available. Today, the school has an OC12 ATM network that it sees as the best solution to handle an ever-expanding number of video-based applications on the intranet.

"The video servers require a more mature quality of service than we can get from Gigabit Ethernet," says Doyle Friskney, associate vice president of information systems at the university. "And with ATM we could go from OC12 to OC192

Looking Beyond Hardware and Software

When it comes to making networking infrastructure choices, many network managers say that hardware and software isn't always as important as vision and consistency.

"The most important thing to do is to pick a player and stay with them," says Doyle Friskney, associate vice president of information systems at the University of Kentucky in Lexington.

"If you're going to go with Bay Networks, go with Bay for switches, routers and ATM. It's going to be tough enough to introduce quality of service. If you put a little bit of everything into the network trying to do lowest cost, you end up with the lowest common denominator," he explains.

Jim Gagan, director of networking and communications for the University of North Carolina at

Chapel Hill, says that network managers should remember that they aren't just purchasing products but rather a "technology direction" that should carry them into the future.

"We invest more in strategic direction and overall architecture than in lowest cost per part," he says. "We're not buying to address only today's concerns but also to make sure that products are developed and will be available to meet our needs two, three or four years down the road."

"THE MOST important thing to do is to pick a player and stay with them."

DOYLE FRISKNEY
UNIVERSITY OF KENTUCKY

Companies need to think very carefully about future business growth and about the types of applications they would like to put on the network when the expansion occurs, explains Jim Boldorovic, an industry analyst at Zoss Research, Inc. in Redwood City, Calif.

"If I've got 100 people now but expect the business to triple in size, I want the network to have the capacity to do that without having to rip it out and replace it," he says. "Companies should ask: How big are we going to get? What are we going to do on the network? Are we going to do E-commerce? Are we going to do in all of the inventory and manufacturing applications?"

The payoff, Boldorovic says, is great. "The more proactive a company can be in doing that, the more likely that the network, when finally built, will meet their needs."

GROUP WISE

INFRASTRUCTURE

and beyond."

As far as short-term solutions go, analysts say that load balancing — managing requests and re-routing traffic around clogged servers — is among the most popular.

"Say my server in New York is getting pounded," posits Jim Balderston, an industry analyst at Zona Research, Inc. in Redwood City, Calif. "I can route customers to my server in Chicago. They may have to go further over the network and that may cause some network delays but at least they are getting some satisfaction."

Users can also load balance among local servers. That's exactly what Eide Bailly's Stone says he recently asked engineers in his department to do on a pair of servers running NetWare 4.11.

"It's a short-term solution," he says. "But we'd like to have it implemented before our next tax season coming up here."

Network managers can ease their minds about at least one topic. While the Internet backbone is slowly moving to a new standard, IP Version 6

"WE'VE CREATED THESE giant roads to get to the ballpark, but people can't get in because the doors are too small."

DAVID STONE
EIDE BAILLY

(IPv6), analysts say that it's far too soon to worry about it.

"What most people want it for — the security features — have been built into v4," says Maribel Lopez, an analyst at Forrester Research, Inc. in Cambridge, Mass. "So therefore the only thing left would be addressing space, which can be taken care of with internal address-

ing or using one IP address to the outside world."

That's certainly a relief to the network managers grappling with how to create space for an ever-swelling tide of intranet applications. At Eide Bailly, those include a Microsoft SQL database currently in production that would provide a directory of specialties for every accountant in the com-

pany. There's also the back-to-the-future application that will allow customers to do online reporting of critical accounting information.

"We see a tremendous potential for using the Internet to service our clients," Stone says. "The bandwidth demands are only going to increase."

PROJECT: BROCADE COMMUNICATIONS SYSTEMS

Switching Gears to Speed Simulations

By Steve Alexander

Despise its expertise in data center networking, 3-year-old Brocade Communications Systems, Inc. in San Jose, Calif., found itself no better off than nontechnology firms when it came to intranet congestion. Brocade sells high-end data center switches that are used to connect server clusters to storage arrays and enable any server to

talk to any storage unit. But that technology isn't designed for intranets. As a result, 130-employee Brocade looked to outside switching vendors to solve the intranet transmission speed bottlenecks that were slowing Brocade's new product development, which relied on running large software simulations over the intranet. An initial hardware upgrade was made a year ago, and by year's end Brocade hopes to further improve performance by consolidating many switches into a few switch chassis'. Josh Judd, Brocade network engi-

neer, explains what had to be done.

WHAT THEY'RE DOING

Our pattern of intranet use required higher speed because we have machines running simulations and compiler to network file servers as part of new product development. If the connection to the file servers is slow, that is a bottleneck in product development. So obviously it is in our best interest to make that fast. We looked to outside vendors because the intranet upgrade required different technology than we sell.

WHY THEY'RE DOING IT

Our intranet is scaled for current requirements, but there is not much breathing room. Today our intranet uses a mixture of Gigabit Ethernet and 100M bit/sec. and 10M bit/sec. Ethernet, all switched.

If we did nothing to improve the intranet, we couldn't add many more switches to the switch array we already have because there are physical limitations on the number of ports available. In addition, as you add switches to this kind of array it gets exponentially harder to manage in terms of configuration changes, troubleshooting and other management tasks. A switch chassis was definitely the way for us to go from a management standpoint.

But at the time we purchased this equipment a year ago, we couldn't get it in chassis form. As a result, we have 27 workgroup switches (FastIron Workgroup Switches) and six backbone switches (FastIron Backbone Switches) from Foundry Networks, Inc. in Sunnyvale, Calif., all interconnected with Gigabit Ethernet. Working with Foundry, we'd like to reduce that system to a couple of chassis'.

The advantage on a chassis is that it has a lot of ports, so most things that need to talk to each other can be on the "A" chassis. You can put slower things on the "B" and "C" chassis', which, by trunking together several one gigabit lines, can be linked to the "A" chassis with eight gigabits of bandwidth. We need about 500 workstations, compute servers, disks and printers, so we probably will end up with three chassis' in December or January.

HOW THEY'RE DOING IT

We're doing it in stages. A year ago we had shared 10M bit/sec. hubs chained together using 10M bit/sec. Ethernet switches. To improve that speed, we did a major upgrade about a year ago by adding the Foundry switches and faster Ethernet. Later this year we'll do the upgrade to the chassis, not to improve speed but to improve manageability.

BENEFITS

Besides giving us better bandwidth, the next upgrade will improve intranet man-

agement. We didn't look at ATM because it's slower and more difficult to set up, and it would have required replacing a whole lot of host adapters because ATM won't plug into an Ethernet port. If we stuck with Ethernet, we would not have to change anything.

COSTS

A year ago the upgrade cost us \$250,000. This year's upgrade was thrown in as part of that because we are beta testing Foundry Networks' equipment.

RETURN ON INVESTMENT

We don't waste time on it. If I go to the engineers and ask, "Are the simulations running faster?" they say, "Way faster." And that is enough of a quantification. All of our management and engineers are network people, so they know what "way faster" means.

ADVICE TO OTHERS

Be really sure you know what you want to get out of a network upgrade before you do it. Do you want faster network connections, ease of management or cost savings? The big plus on Foundry is that all the stuff that comes up often is really easy to do. The hard parts with Foundry are configuration changes and troubleshooting, things that don't come up often. But you have to know what you're trading off.

Alexander is a freelance writer based in Edina, Minn.

FINALLY, NO-SWEAT NET.

It's not easy to get access to the network resources you need from anywhere in the world.

You need to get to the ISP, in the VPN, through the Firewall,
off the Proxy Cache, into the Web Server, get the files and get them out again to the printer.

And you need to do it fast.

How can you help your users navigate this growing complexity?

[Novell. BorderManager™ makes it possible.]

BorderManager is the complete security management solution
for networks integrated with Novell Directory Services.

And with single sign-on your users can access external and internal networks using only one password.

BorderManager reduces the cost of managing corporate networks,
and increases bottom-line productivity.

Security, access, control.

BorderManager is the solution to make all the networks act like one network.

Visit our Web site to obtain a free trial version today.

Your year 2000 project may be in trouble if . . .

Michael Cohn

The clock's ticking. You're swamped. Your year 2000 project is way behind. Yet the grown-ups on Mahogany Row still think it's a hoax. They laughingly boast that they'll be flying commercial on Dec. 31, 1999.

Well, flying is one thing; landing's another. Take my advice: If your year 2000 project exhibits any of the traits on this list, you're dead meat. But stay calm. It's not yet time to place your head between your knees. With luck and hard work, you can fix the fiasco of year 2000 . . . probably by 2000.

1. Your project team's first meeting dissolved into a noleee over whether 2000 is really a leap year. (Worse, one of your best programmers took a cinnamon roll in the eye and quit on the spot.)

2. Your project manager now insists you call him "Commandant," has piled sandbags around his desk and claims it's stupid to keep remodeling 15 million

Your request for bonuses is under consideration; HR suggests casual Fridays as a retention strategy.

lines of assembler code when 60% of the world's nations have barely started—including several with nuclear capability.

3. The megapriced time-and-material consulting firm that's been working on the project since 1994 promises the assessment phase is almost complete and should have an inventory to you "any day now."

4. Two of your LAN administrators swear they can make every 286-based

PC in the place year 2000-compliant simply by shucking it really hard on the side at 11:59 p.m.

5. Human resources says your emergency request for retention bonuses is "under consideration" and suggests casual Fridays as an alternate retention strategy.

6. Your contingency plan consists of Stella down in payroll, who thinks she still has a manual typewriter in one of the kids' closets.

7. You bought an expensive tool that can set a mainframe's date back 28 years. Now the vendor claims that you haven't paid the license fee since 1970.

8. Your CEO pret in front of a camera and says, "We budgeted \$300 million for year 2000. My neighbor's kid flooded the whole thing over Labor Day weekend for forty bucks. Mowed my lawn, too!"

9. Fortunately, your mission-critical, million-lines-of-code vendor has finally finished making its package "year 2000 functional." Unfortunately, that means it functions until 2000.

10. The CIO still claims that he can fix 300 million lines of code manually and

plans to bring contractors on board in 1999. About \$7,000 of them.

11. You asked the vice president of manufacturing to assess all the embedded systems in 42 plants worldwide. The only noncompliant device he came up with was a Mr. Coffee in a break room in Topeka.

12. The executive committee has concluded that it can solve the problem by replacing 16 of your core corporate systems . . . and plans to start writing a request for proposals right after Christmas.

13. You finally get a meeting with corporate counsel after 15 phone calls. The first thing he asks is, "What exactly do you mean by the term 'year 2000'?"

14. You plan to devote 50% of your time and money to test boxes, test tools, test staff, test direct-access storage devices, regression tests, integration tests, data agers and path-coverage analyzers, which at this rate can all be in place some time around March 2000.

15. There's a shrine to Bill Gates in the computer room, and third shift nightly prays he'll soon come up with something to fix this whole mess. □

Cohn is working hard on year 2000 and plans to fix many, many years to come.

Virtual Viagra for flaccid apps

Michael Schrage

In a recent interview, Oracle CEO Larry Ellison tossed off a comment about his company's new database software capabilities that was really more revealing about the industry's hardware capabilities.

He might have provided greater insight into corporate software's future than he intended.

Ellison talked—perceptively—about how ever-faster processor speeds have enabled Oracle's new database software to cost-effectively take over the tasks of network and desktop file management. Now I don't do applications benchmarking, but Ellison's observation struck both a computational chord and a network nerve. Quantitative differences in hardware development do lead to qualitative differences in software development. Could investing in faster hardware consistently yield greater returns than investing in better software development?

Maybe CIOs aren't investing enough attention for money in how best to paralyze the hardware learning curve. Maybe computational brute force will matter a lot more than rigorous software design. That certainly proved true for

IBM's Kasparov-bashing Deep Blue. My best bet is that it will also prove true for much of tomorrow's departmental/networked systems development. At Microsoft's New York DevCon, I had a friendly argument with a consultant/developer about the challenge of scaling up such languages as Visual Basic into greater mission-critical functionality. My opponent argued—persuasively—that Visual Basic is just too darned slow to do a lot of truly interesting stuff (high-volume online transaction processing, for example).

But what happens as processor speeds and I/O rates improve? Well then, he agreed, things could change. Dramatically. It's hardly news that enhancing hardware performance can enhance software performance. Who isn't uttering such tired of the Moby blot that stops through the microprocessors of most desktops? Rather than optimize perfor-

mance, most departmental developers opt to featurize. But precisely what are we featurizing around? Scale matters. So does interoperability. So does speed. Sometimes hardware can play the role of virtual Viagra and give new enterprise life to a flaccid departmental app.

How many organizations have honestly analyzed how anticipated advancements in hardware could best leverage their existing stocks of departmental software? Survey after survey confirms that most companies haven't even done a decent job of inventorying their software applications. Can these companies really be aware of whether the apps they've developed might be qualitatively transformed by the quantitative advances in processors and I/O? With good developers scarce and es-

persive, maybe it makes more sense to throw faster processors and I/Os at problems rather than more sophisticated software development. Maybe it makes more sense to figure out ways to cost-effectively scale down Visual Basic and JavaScript applications to the enhancements in hardware rather than develop new apps from scratch.

I really wonder what the internal development competition is going to be between Visual Basic, C++, Java, JavaScript, Smalltalk and Cobol. I really wonder whether you get a better return by investing in "better" development and developers or in "better" platforms that can propel a legacy departmental app into an enterprise winner.

Let me put this in the crassest possible way: If there is one thing this industry proves beyond a shadow of a doubt, it's that hardware improvements are more predictable than software improvements. Do our investments reflect this reality? □

Schrage is a research associate at the MIT Media Lab and author of *No More Teams!* His Internet address is schrage@media.mit.edu.

Faster hardware may yield greater returns than better software.

WHAT'S IT GOING TO TAKE
TO MANAGE MY DATA NETWORK
WITHOUT HIRING AN ARMY?!

AN ALLY Public networks. Campus networks. LANs, WANs, remotes – your network is more complex than ever before. What's it going to take to get on top of it? (Short of seriously staffing up?) For starters, Lucent NetCare Services. Provides comprehensive Lifecycle Support for networks of every size. From consulting and planning to integration and ongoing management and maintenance. (Our new St. Pete, FL service center has 350 data network experts at the ready to provide the most reliable service around.) We know how to create an easy-to-manage network. And we can help you manage yours. (So you can manage your business.)

We make the things that make communications work.™

Cry of the CIO: 'No mas!'

Bill Laberis

I'm working on a project that has me talking to several CIOs from mostly very large companies. I've asked them to basically pretend that information technology Christmas is coming and it's their turn to make out their wish list, one that will take care of their wants well into the 21st century.

I searched for a common theme in their answers, and I didn't have to look hard to find one. It reminded me of the plea of Roberto Duran who, when the bell rang for him to resume boxing after several rounds of being pummeled, replied in his native Spanish, "No mas." I've had enough. No more.

Here we are about to enter the last year of the millennium. The Internet revolution is in full swing, with its promise to utterly transfigure corporate networks. Sixty-four-bit enterprise computing is upon us now, with 128 bits waiting in the wings. Bandwidth barriers

You needn't be a Luddite to want a breather from rapid-fire IT advances.

are being smashed, and soon a new generation of unanticipated applications will descend on the IT world to leverage these widened data highways. Internet-based electronic commerce has already irreversibly changed venerable businesses such as the securities trade and is now bearing down on just about every kind of commerce known to humankind.

All these seemingly wonderful technological advances lie just over the horizon. But when given a blank paper and asked

to make a wish list, most CIOs said they want less, not more. In fact, reading between the lines of their lists, it's far to say they'd like time to stop for a while, maybe a year or two, just so they can catch up. As one wrote, "There is a point where too much change too fast is just not good, and in some respects we are at that point today."

These people are not IT Luddites. To the contrary, their sentiments are almost identical to those I observed for years in various editorial readership studies, the No. 1 challenge was expressed as, "I can't keep up

with it all."

There's no real blame to be assessed here. Vendors do what comes naturally: produce and market one generation of product after another.

But I do blame vendors in general for their chronic failure to recognize that increasingly, system implementations aren't constrained so much by software incompatibilities or network issues or platform selections. Rather, the biggest constraints are organizational — namely, a company's ability or lack thereof to

manage both process change and people change when the ground is constantly shifting.

Meanwhile, the baseline needs of senior IT managers remain quite pedestrian. For example, IT is trying to figure out how to make Unix and Windows NT coexist; after all, the two are very different operating systems whose files users want to share in great numbers. Not one of the looming whiz-bang technologies I mentioned above will do anything to help IT manage this pervasive and business-critical issue.

That's the same kind of challenge the old-line MIS department faced 15 years ago when it tried to harmonize incompatible operating systems and hardware platforms — from the same vendor (IBM), no less.

It constantly hears that the future is now. But seen in the light of many contemporary challenges, the future is yesterday. Is it any wonder that a CIO's wish list is likely to illustrate a case of less being more? □

Editor in chief at Computerworld from 1986 to 1996, Laberis is now president of Bill Laberis Associates, a consulting and publishing company in Holliston, Mass. His Internet address is bill@laberis.com.

Microsoft according to Shakespeare

David Moschella

Before we get lost in the details of the upcoming battle between the U.S. Department of Justice and Microsoft, I think it's a good idea to step back a bit and get a cultural perspective on what major antitrust confrontations are really all about.

And what could be more cultural than seeking wisdom directly from the Bard of Avon? Surely, no one has written more frequently, subtly and humanely about the nature of power, ambition and justice than William Shakespeare.

Unfortunately for Microsoft, most of what the great man has to say is clearly on the side of the Justice Department. Throughout the Shakespearean canon, few themes are more consistent than how excessive ambition often leads to personal destruction and social chaos.

Indeed, in one of Shakespeare's most famous works, we learn that uncontrollable ambition is the fatal flaw of the otherwise noble Macbeth. Worse still, when coupled with revenge, unchecked ambition leads to the high villainy of Richard III or Edmund in *King Lear*.

In contrast, the ideal Shakespearean

leader, Henry V, uses his strength and satisfies his ambitions but recognizes that both sometimes need to be restrained.

In addition to those memorable characters, one of the more amazing things about Shakespeare is that he has conjured up quotes for seemingly all occasions. Here are a few worth keeping in mind during the coming month:

"O, it is excellent to have a giant's strength; but it is tyrannous to use it like a giant." *Measure for Measure*, II.ii.107

"But 'tis common proof that lowliness is young ambition's ladder, whereto

the climber-upward turns his face; but when he once attains the upward round, he then unto the ladder turns his back, looks in the clouds, scorned the base degrees by which he did ascend." *Julius Caesar*, II.2.2.

"Then every thing include itself in power, power into will, will into appetite, and appetite, a universal wolf (no doubly seconded with will and power), must make perforce a universal prey, and last eat up himself." *Timon* and *Cymbeline*, I.iii.119.

"I have no spur to prick the sides of my intent, but only vaulting ambition, which o'erleaps itself, and falls on itself." *Macbeth*, I.vii.25.

Unfortunately for Microsoft, most of what the great man has to say is clearly on the side of the Justice Department.

"We must not make a scarecrow of the law, setting it up to fear the birds of prey, and let it keep one shape, till custom make it their perch and not their terror." *Measure for Measure*, II.1.1.

Of course, Shakespeare's timeless tales of heroes and traitors and love and war are far removed from the narrow business disputes of today. Nevertheless, the underlying issues are often remarkably similar. Current antitrust law is founded on the very Shakespearean belief that giving too much power to any one company or man is fundamentally not a good idea.

To win its case, the Justice Department will have to show that this is one of those times when the common good demands that the strong be reined in. Shakespeare would likely agree. For him, the tougher question would be whether this particular story will play out as a comedy, where all's well that ends well, or as tragedy, where the great as eventually must fall. □

Tivoli

control everything

everywhere

The power

- To easily manage your systems, networks and applications from a central point.
- To roll out hot new applications to thousands of users, all at the same time.
- To create customized solutions using best-of-class products from hundreds of partners.
- To protect your information systems and investments, now and down the road.

All through one incredibly open and scalable technology. Supported, worldwide, by IBM.
That's the power of Tivoli Systems Inc. Visit us at www.tivoli.com or call 1 888 TIVOLI1.

INTRODUCING THE DELL® POWEREDGE® 6300 SERVER

Here's a novel idea. Not only will we custom build your Dell PowerEdge 6300 Intel®-based server from the ground up, we will continue to help you manage it even after it's installed.

The PowerEdge 6300 features a hot-pluggable design that allows you to replace the hard drive, PCI cards, power supply and redundant CPU cooling fans without ever taking the server down. That's availability.

This server also grows with you. It can accommodate up to four Pentium® II Xeon™ processors, 4GB of ECC memory and seven hot-plug ready PCI slots. That's scalability.

And, Hewlett Packard's OpenView Network Node Manager Special Edition and our optional Dell Remote Assistant Card-2 help you keep your network running smoothly, both remotely and locally. That's manageability.

So now you know the PowerEdge 6300 is more than capable of handling your data center computing needs, but here's the best feature. Peace of mind. Dell will be there to back up this server 24 hours a day if anything should go wrong. And that's our promise. Call Dell today and we'll take care of you. 1-800-285-6840

Top 100 IT products list draws some disagreement

TO PREPARE a list of the top 100 IT products with "major impact" ("My top 100," CW, Aug. 3) and not include the C programming language takes some doing! (Especially with Microsoft's Basic ranked so loftily.)

Aside from being the lingua franca behind a slew of applications, its roots are closely intertwined with those of Unix, the solid operating system that just keeps going and going and going...

It's a shame that this widely used language was "gone with the wind" on Frank Hayes' personal top 100.

Bob Nelson

Dallas

bnelson@iname.com

WHERE is the Cisco router on your top 100 list?

The most powerful server, with however many processors, can't compete with a dedicated router with a microkernel and on-board diagnostics. Cisco started with a small box that would calculate and organize packets for maximum efficiency using the utmost in logic. That's all.

It beat the living "6 to 40 of anything in the market for routing.

Kerrie Scott Korgis

Senior systems engineer

Network Appliance, Inc.

Santa Clara, Calif.

kskorgis@network.com

WHOA, FRANK! NextCube is a top 100 IT product?

Let's give it an overall design award at best. And Delphi is very overrated, in my humble opinion.

Here are a few things I think you left out: the Pick operating system (still humming along); the Burroughs B-3500 (the first really productive virtual mainframe); and the Cray-1, of course.

I would also add Paradox for DOS (the best small relational DBMS ever), SAS software (the best friend a programmer ever had) and PC/370 (which lets you write IBM 370 Assembler language on a PC).

Earnest Allmon

Baylor University Medical Center

Dallas

HAVING BEEN in data processing for 37 years, I was impressed with the diversity Frank Hayes' list showed.

It brought back some memories, but there is one very important item missing. That is the simple So-column card, without which many of the items included would not work very well. Even though the physical card has pretty much disappeared from the scene, there are still many "card image" functions using the original So-byte format.

Another item I would have selected is IBM's IMS database management system. You must admit that a process that is 30 years old and still going strong has got to be impressive.

But thanks again for the list. I enjoyed it. I wonder how many of your younger readers could identify some of the earlier items?

Robert L. Shotts

Database administrator

Wal Mart Stores, Inc.

rlshotts@spynet.com

THERE was one product you seem to have left off your list altogether: IBM's IMS database product. It was a landmark in the ability of IT shops to create rapid-response transactional systems. It's only in recent times that relational systems have had access to the horsepower that makes them competitive for transactional systems. Throughout the '60s and early '80s, IMS was pervasive. It

led to the rise of the database administrator and a number of other specialized roles within IT.

Michael T. Albense

Stackell Consulting

St. Louis

Michael.T.Albense@Energycenter.com

IMPROVED the top 100 list and think it's a good start.

But there were a couple of glaring omissions, such as BITAM/TCAM and all that early networking stuff that let companies build big networks and get terminals in front of lots of people.

I would also include Cincom, the first commercial database software company. It showed the way and is still around.

Rich Whortson

Director, consulting and services

Delphi Technology, Inc.

Cambridge, Mass.

rwhortson@delphi-tech.com

FRANK, YOU must be younger than your picture makes you appear. You should have included the backbone duo of every major data processing shop I've ever been in—Cobol and IMS.

While Cobol II is a very worthy product, the original Cobol should not be forgotten.

Thomas P. Johnson

Database consultant

Cigna Systems/

CTS Database Products

Voorhees, N.J.

Thomas.Johnson@CIGNA.COM

I WAS OBLIGATED to see Frank Hayes' high rating of Profis. I was an IBM employee at Endicott in the late 1970s, early 1980s and ended up being part of the production work.

more or less driving the debugging effort.

It was the most intense work experience I ever had. The prototype was both unfinished

and full of bugs, and we fixed and enhanced at the same time. Interestingly, it was a client/server design, correctly built so that no backer could get into the server.

However, I was surprised to see Digital Equipment Corp.'s VMS missing from the top 100 list. It was one of the best operating systems ever built.

And Microsoft Play belongs nowhere on any list (it is derivative). Windows 3.1 is also derivative.

But you should name the Macintosh because it forced Microsoft to copy its functionality over the next 10 years. Bill Gates has not invented anything himself, although he has shown the world how to market.

John E. Mann

Sewersville, Minn.

johanna.mann@midwestnec.com

FRANK, FRANK, FRANK! Boy, did you screw one up big time!

The world's first 32-bit mini-computer was the DEC VAX 11/780... not the PDP 11/70. Also, I don't see NCSA Mosaic on there. (There would not have been a Netscape without it.) I would replace the MicroVAX 3500 with the MicroVAX II. Linux is rightly there, but so Unix? Just DEC Ultrix?

Jim Jennis

Senior specialist/manufacturing

and information technology

Java promise unrealistic

COMPUTERWORLD'S story about Sun Microsystems' Java technology ("Network nirvana promise revised," July 10) was completely off-base, but many of the technical details about competing products were at least partially accurate. I was particularly impressed to see that the writers dug up the Microsoft Millennium project, although their description of Plug and Play as a Windows-only feature is misleading. Plug and Play is a publicly documented (and relatively simple) hardware standard.

The problem lies with the overall message. A bank using Java to automatically make two disparate systems "talk" without conversions? Pure fantasy. Data formats and communications are only microscopically small parts of the problem. The main problem is the information itself: what is stored, logical relationships, business assumptions reflected by the data and so on. With the possible exception of being a useful general programming language, Java offers absolutely nothing to someone facing this kind of conversion.

I love Java as a language, but Sun promotes unrealistic expectations and makes embarrassingly bad marketing decisions. Java isn't even close to being able to provide the described functionality, short of throwing out your entire system and starting over.

Jon McGuire

Merrill Lynch & Co.

jon.mcguire@ml.com

'Hate' moniker misleading

YOU WHOLESALERS characterize the independently operated computer Web sites as "rogue" or "hate" sites ("Your Company Name Here—suchs.com," CW, July 10) is inaccurate.

It violates a basic principle of objective journalism by using loaded terminology to encourage the reader to believe that all these sites are somehow morally or ethically wrong. Many of them offer only a forum for sharing of legitimate complaints against shoddy business practices. Shame on you.

COMPUTERWORLD HEALTH CARE CAREERS

**Join the team that has the
Intellectual Advantage™**

Healthcare IT Consultants

*We provide excellent compensation,
competitive benefits, and flexible travel
schedules. Relocation not required.*

We are an information technology consulting firm dedicated solely to assisting healthcare institutions, integrated delivery networks, and related organizations achieve their financial and clinical objectives by more effectively using their information systems. Clients choose us because we provide high-quality, cost-effective, and customer-responsive consulting services. Employees choose us because we provide meaningful work, an open and creative environment, and a genuine concern for family and community.

Isn't it time you choose us?

*Elumen Solutions offers special
expertise in supporting some of
the most respected vendors in the
healthcare industry including:*

**SMS® • Cerner® • MEDITECH • HROC
IDX® • STC • HIE • CAI**

Currently, we are seeking consultants with
the following experience:

Software Implementation Solutions Cerner®

Candidates must have Cerner clinical product application expertise.

HROC HealthQuest® 2000

Candidates must have Clinicpac or Medipac technical or functional
experience.

HROC Plus 2000 (previously IBAX Series 5000)

Candidates must have ABS/PCS and Cobol technical or function
experience.

HROC STAR/PATHWAYS

Candidates must have clinical, financial or project management
experience with these product applications.

IDX® LastWord

Candidates must have Tandem and Cobol programming expertise or
candidates must have LastWord technical and functional expertise.

MEDITECH

Candidates must have 4.6, 4.7, or client server experience with
Meditech's clinical or financial applications.

SMS® Janelian

Candidates must have DAS and clinical or financial experience.

Systems Integration Solutions

We are seeking candidates with STC Datapac, HCI Coverleaf, CAI or
HUMPS programming experience.

Managed Outsourcing

We are interested in quality health care, information technology
executives, directors and project managers who will participate in
providing outsourcing solutions to the industry.

Forward your resume to Wendy Kadner at:

Fax (913) 685-4673 e-mail wkadner@elumensolutions.com internet www.elumensolutions.com

A PRESCRIPTION FOR SUCCESS

True, every industry is desperately looking for quality IT professionals, but the health care industry faces even more difficult circumstances.

Health care ranked third in anticipated IT hiring this year after business services (other than IT) and education. It projects a 3.1% increase in permanent staff in the next three months and a 14% increase in the next year, according to *Computerworld's* July 1998 quarterly hiring survey.

And filling the ranks with top-notch talent won't be easy. The industry has to convince would-be hires that its negative image — antiquated systems and limited respect for or understanding of IT — is a thing of the past. But as our Health Care Careers Directory shows, health care is finally sporting a snappy new look. Business as usual is being replaced by critical IT directives driven by a variety of patient care and operational efficiency metrics (the by-product of analysis outcomes and managed care initiatives), not to mention year 2000 exigencies and data privacy concerns wrought by government mandates.

Addressing these issues requires advanced technology, which should translate into challenging IT projects. And the need to innovate — and quickly — is proving to be health care's drawing card with new hires. The chance to rebuild or modernize systems presents a significant opportunity for IT folks and certainly doesn't look bad on a resume.

And as IT establishes a more strategic role in health care organizations, the job of the CIO is becoming increasingly critical. CIOs must exhibit a combination of business and technology skills and balance the needs of both sides of the house.

To succeed, the CIO must find ways to work around health care's historic compensation shortcomings, and that means finding clever and constructive ways to land talent. Convincing them that taking less money to work on challenging projects is one well-worn approach. Making it work is something else.

Just how successful health care will be in its aggressive recruiting remains to be seen. But one thing is sure: Health care is no longer a technology backwater.

CHANGING PERCEPTIONS

**LONG KNOWN
AS A TECHNOLOGY
LAGGARD,
HEALTH CARE
ENTICES HIRES
WITH NEW
TECHNOLOGY**

Like most other information sciences soon-to-be graduates of the University of Wisconsin at Parkside, Julie Heydikhor was sought after by several companies during a campus recruiting fair. And she was intrigued by at least two of them. But only Allergieca Healthcare Corp. called her back for a follow-up interview within 24 hours, made her see after hours the next 48 hours were up, arranged for her to visit the company's facilities in McGraw Park, Ill., and essentially let her choose her job.

"They let me decide which group was the better fit for me," says Heydikhor, who joined Allergieca in January 1997 as an associate program analyst. During her visit to the company's headquarters, Heydikhor spent several hours with IT employees, watching them work and being introduced to the company's applications. She also went to dinner with managers from the two departments that wanted to hire her. "I wasn't thrown into something that didn't interest me," she says.

By Sharon Watson

Naydibor's story illustrates the IT recruiting principles of many health care organizations: Grab good prospects fast, and then keep them happy.

The stakes are high. Information technology, once relegated to patient financial systems, is now at the forefront of health care in the form of computerized patient records, online disease management protocols and clinical pathways, clinical and financial data warehouses, automated materials management systems and more.

The point of all the technology is to fulfill the promise of managed care by making health care efficient enough to deliver high-quality care at lower costs. But while providers and other

health care organizations need to build new technological infrastructures, recruiters and consultants agree there's a shortage of experienced talent.

Health care ranks third among industries expecting the largest increase in IT staffing. The industry projects a 3.1% increase in permanent staff size in the next three months and a 14% increase within the next year, according to *Computersworld's* July 1998 quarterly hiring survey (CW, July 6).

HOT SKILLS

"We're competing with all the other technology and window firms for talent," says Kathy Brittain White, senior vice president and CIO at Allegiance.

The company is completing an installation of SAP AG's R/3, moving to Windows NT and working with Oracle Corp. and Business Objects, Inc. "There are no cold skills. Even Cobol is hot," she says.

In addition to Cobol — which is needed to tackle year 2000 issues and, in some cases, to maintain legacy systems — the industry is in particular need of networking, Windows NT and client/server experience, say recruiters and industry CIOs.

Project management and clinical expertise also are in demand, says Linda Hodges, executive vice president at Herber Associates Ltd., a health care

Navidhor's story illustrates the IT recruiting principles of many health care organizations. Catch good prospects fast, and then keep them happy.

The stakes are high. Information technology, once relegated to patient financial systems, is now at the forefront of health care in the form of computerized patient records, online disease management protocols and clinical pathways, clinical and financial data warehouses, automated materials management systems, and more.

The power of all the technology is to fulfill the promise of managed care by making health care efficient enough to deliver high-quality care at lower costs. But while providers and other

health care organizations need to build new technological infrastructures, recruiters and consultants agree there's a shortage of experienced talent.

Health care ranks third among industries expecting the largest increase in IT staffing. The industry projects a 3.1% increase in permanent staff size in the next three months and a 14% increase within the next year, according to *Compuserworld's* July 1998 quarterly hiring survey [CW, July 6].

HOT SKILLS

"We're competing with all the other technology and vendor firms for talent," says Kathy Brittain White, senior vice president and CIO at Allegiance.

The company is completing an installation of SAP AG's R/3, moving to Windows NT and working with Oracle Corp. and Business Objects, Inc. "There are no cold skills. Even Cobol is hot," she says.

In addition to Cobol — which is needed to tackle year 2000 issues and, in some cases, to maintain legacy systems — the industry is in particular need of networking, Windows NT and client/server experience, say recruiters and industry CIOs.

Project management and clinical expertise also are in demand, says Linda Hodges, executive vice president at Hersh Associates Ltd., a health care

Continued on page 4

Continued from page 3

recruiting firm in Northbrook, Ill.

To compete more effectively for such talent, health care recruiters are increasing their visibility on college campuses, dedicating human resources staff to IT recruiting, streamlining the recruiting process and increasing salaries.

"We may be competing with companies like SAP, but if we can just get recruits in the door, they see that we're just as driven by IT and that they'll be working with very advanced technology," says Elizabeth Bean, corporate recruiting manager at NovaCare, Inc. in King of Prussia, Pa.

Several IT staffers relatively new to health care or who have

moved from one health care organization to another agree that the opportunity to work with cutting-edge technology was crucial to their career decision. For example, Naydhor is working on a new just-in-time materials management system as part of Allegiance's SAP implementation. She also uses Visual Basic 3.0 and SQL Server and will help develop a Web-based supply-ordering electronic commerce system designed for physician practices. "There are opportunities in health care that you don't find anywhere else," agrees Stephen Smith, manager of clinical systems at the University of Pennsylvania Health System (UPHS) in Philadelphia.

With 10 years of IT experience at the Medical Center of Delaware, Smith was sought after both inside and outside the health care industry. He chose the university even though its systems were 10 or more years out of date because he knew he'd have the opportunity to build new ones from the ground up.

"I have an opportunity to make a much bigger impact here than I would

elsewhere," Smith says. To give prospects a taste of the technical opportunities health care offers, Allegiance is developing an on-campus virtual internship program, says Stacy Cox, human resources manager for the company's IT department.

The company will select up to eight students to work on Allegiance projects throughout the school year via workstations it will install in a "virtual technology center" on campus. Allegiance will conduct a pilot program at Arkansas State University this fall. The hope, Cox says, is that the participating students eventually will become Allegiance employees.

HIGH PRIORITY

As further evidence of IT's strategic importance, many health care organizations have followed the lead of other industries and now have a human resources staff person who specializes in IT. Stacy Griggs, human resources generalist at UPHS, manages all human resources activities for the IT department, including compensation packages, and he consults on department organization.

"It sends a message that my office is just 50 feet away from our CIO's," he says.

Fast turnaround on IT resumes and interviews is also becoming the norm. At NovaCare, people submitting IT resumes receive responses within 24 hours, and if interviewed, they receive a response also within 24 hours, says Jean Donato, a recruiter for the company's support services.

"Qualified candidates are on the market for just one to two weeks at best," she says. "We have to attract them and make offers much more quickly now."

In general, recruiters say they don't use the Internet much in their recruiting efforts, preferring instead to cultivate networks of personal contacts they can use to identify candidates.

Whether offers made by health care

organizations to IT prospects can compete with those made outside the industry is unclear. Health care ranks the lowest of nine industries in pay scale, and that's a difficult obstacle to overcome, says Daniel Vogel, vice president, health care information technology strategies, at Meta Group, Inc. in Stamford, Conn.

"There's a big sucking sound coming from the hospital side as they lose people to vendors and other industries," he says.

Provider pay scales may lag for several reasons. Vogel cites the generally accepted statistic that most providers spend just 1% to 3% of their revenue on IT investment, compared with as much as 9% in other industries.

Other sources suggest that human resources staff who don't understand the vital new role of technology in health care may also contribute to the problem. "Almost all of our clients have

had to work closely with their HR staff to address salary issues," Hodges says.

But many providers say they have yet to see health care-specific vendors dare to raid their staffs for fear of soured important business relationships. And sometimes talent flows from the vendor to the provider.

That's been the case at Winchester Hospital in Winchester, Mass., where Michael Gogola, vice president and CIO, has attracted people from Medical Information Technology, Inc. (Meditech), his hospital information systems vendor, as well as other health care organizations.

Gogola says Meditech hires many new graduates, some of whom put in time at his site and are attracted to the technologies he's implementing, including handheld devices and data warehouses. They also act as an informal recruiting network with other classmates and Meditech peers, he says.

Health Care IT Salaries

Average total compensation
(Salary and bonuses)

CIO/VP of IS/IT	\$104,000
Director of networks	\$76,000
Director of IS/MIS	\$74,000
Director of systems development	\$72,000
Director of IS operations	\$64,000
Project manager	\$59,000
Project leader	\$57,000
LAN manager	\$56,000
Senior systems analyst	\$55,000
Senior systems programmer	\$54,000
Database manager	\$54,000
Programmer/analyst	\$43,000

Source: Computerworld's 1998 Salary Survey

In slightly more than a year, Gogola has rebuilt the hospital's IT department from the ground up, replacing consultants with about thirty staffers. When necessary, he makes salary adjustments to ensure parity between the newest recruits and existing staff.

"Those adjustments are economical compared to the cost of recruiting and training a new hire," Gogola says.

Some providers also argue that their compensation packages are now on a par with any other industry. "IT has moved up on the strategy ladder as far as integrated delivery systems are concerned, so we've been able to offer more competitive compensation packages," says Matthew Calais, CIO at Legacy Health System in Portland, Ore.

Health care organizations are optimistic that recognition of health care's financial and professional opportunities will come.

"Technology has changed the way we deliver health care," Gogola says. "It's going to be important."

But now, as providers build integrated delivery systems to link hospitals, clinics and physician practices in a continuum of care, they're looking to CIOs to help lead the way.

"CIOs are now being recognized as an integral part of the executive team," says Ward Keever, CIO at the University of Pennsylvania Health System (UPHS) in Philadelphia. "It's now up to us to make certain that we provide the electronic glue that helps to hold an integrated delivery network together."

It's not surprising, given these requirements, that organizations are changing the criteria by which they select CIOs. A shepherd of application implementations isn't enough. Instead, they require someone who can hold his own as a member of the executive management team, as well as with chief medical officers and CIOs at affiliated institutions, recruiters and consultants say.

"If there's a disconnect between the CIO and the rest of the 'O' team — the CEO, COO, CFO — then the CIO is seen as a cost center and as a specific project implementer," says Daniel Vogel, vice president, health care information technology strategies, at Meta Group, Inc. in Stamford, Conn. "You want to be viewed as someone with a vision that can help change the organization," he says.

It's not clear whether a CIO needs previous health care experience to be a successful visionary in the industry today. Health care CIOs say CIOs in any industry have the basic business skills necessary to survive in health care.

However, many providers are looking for CIOs with health industry experience to eliminate the six-month to one-year learning curve most CIOs from nonaffiliated industries face, says Linda Hedges, executive vice president at Hersher Associates Ltd., a health care IT recruiting firm in Northbrook, Ill. "We hear from many clients that they would like to look outside the industry for candidates, but they're

Information Systems/Technology

Alliant Health Systems has recently doubled in size adding four hospitals in our Louisville, Kentucky local network and we now have unlimited opportunities in Information Systems/Technology.

IS/IT OPPORTUNITIES

We have positions appropriate for candidates right out of college or with 20 years of experience. We are interested in IS/IT professionals with various levels of experience in one or more of these areas:

- Information systems
- Program management and local analysis
- "Big" project leadership
- Advanced technological network management
- Desktop and web development
- IT systems

As a premier healthcare provider, Alliant Health System offers several benefits to an IS/IT professional, including:

- Opportunities to work with the latest, state-of-the-art technology within a major area health system
- A team-oriented environment and diverse culture
- A chance to make a mark within a premier organization in a time of great and positive change
- Competitive compensation and benefits packages tailored to the individual

in the midst of so much change that they feel they don't have time for such a long learning curve," Hodges says.

CIOs also say it's possible for technical staff to rise through the ranks to become a CIO, as long as they have the aptitude for the myriad aspects of the position.

VISION QUEST

Wherever their origins, health care CIOs are quick to agree that they must be strategic thinkers, even visionaries, to earn the respect of their IS departments. "You must understand the business you're in and show how you'll deliver strategic value to the organization," says Steve Wise, senior vice president and CIO at NovaCare, Inc., a national health care services company in King of Prussia, Pa.

Wise, for example, led the creation

of a 1,500-site network that provides managers with daily data feeds of clinical, financial and outcome measures from a central repository to evaluate practice performance. The company also uses aggregated statistics for planning, marketing and business development. "We aligned the system with the company's business needs," Wise says.

Once a successful alignment is achieved, the CIO must constantly remind people of IT's role in the success, Wise says. Such communications skills—in particular, the ability to drill complex IT implementations into clear, strong explanations of how the technology will benefit the organization—are invaluable, CIOs say. In addition, building good relationships with other senior executives is vital.

CIOs also must forge good working relationships with the CIOs of organizations with whom their parent organizations affiliate, such as physician practices, providers and payers. But of all these relationships, the one between the CIO and the CEO is the most critical.

"Your CEO must be someone who understands that technology provides strategic value," Wise says.

CSC is an Equal Opportunity Employer M/F/D/V.

Top Attributes

Here's what CIOs, consultants and recruiters say the perfect health care CIO should be:

- **LEADER:** Hold own with senior management, including key medical staff and CIOs at affiliated institutions.
- **VISIONARY:** Develop a compelling but practical technology vision, create administrative efficiencies and help the organization thrive.
- **TRANSLATOR:** Present technological applications in terms of strategic deliverables.
- **COACH:** Mentor and motivate IT staff.
- **POLITICIAN:** Build solid relationships with various constituencies, including physicians and CIOs at affiliated organizations.
- **SOOTHASAYER:** Make right calls on where to spend limited capital dollars.

Continued from page 9

The CIO and CEO must also come to an understanding about accountability, CIOs say. UPFIS's Keever talks about the importance of having a covenant-style relationship with his CEO as compared with a contractual one.

Keever says he also tries to build covenant-based relationships with his staff in the sense that he supplies vision and strategy and then allows his IT directors and their personnel to implement them with minimal scrutiny. "My job is to create an environment in which people excel beyond their abilities," he says.

Other CIOs echo Keever. "I act as a mentor or coach," Wise says. "I want to let my people work and build relationships with their constituencies, too."

That wide scope is necessary for setting priorities for IT projects — a key

success factor for health care CIOs, they say. "The demand for IT exceeds the dollars available, as well as the ability to digest change," says John Glaser, senior vice president and CIO at Partners HealthCare System, Inc. in Boston. "The CIO has the challenge of juggling and prioritizing to reach a balance that is supportable."

Balancing health care's huge backlog of IT projects with available dollars limited by decreasing reimbursements and cost pressures is one of their greatest challenges, CIOs agree. First, they warn it's important not to raise expectations that IT's main goal is to lower costs. "There's a lot more to be gained," Wise says, in terms of greater efficiencies, higher quality patient care and stronger market positioning. Most CIOs say IT costs must first increase before the organization can benefit, a legacy of health care's past underinvestment in IT.

Also, many health care IT projects are extraordinarily complex, so CIOs must try to focus on those aspects of an application that will have the greatest impact in the shortest time. "Health care easily has five times the number of applications that other industries have," Vogel says.

The applications and the sheer amount of raw data that even a single patient-physician encounter can create in terms of sets of combinations of physical conditions, pharmaceutical prescriptions, test results and outcomes are staggering. "The nature of the data make it exceptionally difficult to computerize," Glaser says.

Further, CIOs of integrated delivery networks are creating master patient indexes, such as unique patient identifiers, that will function in every entry

in the network — from physician office to hospital to outpatient center.

Many also are tackling computerized patient records or data warehouses that draw data from dozens of proprietary systems in settings ranging from labs to supply warehouses to business offices. So as their staffs try to span technical gaps, network CIOs say they find themselves leading efforts to build strategic bridges among heterogeneous working cultures and other information officers.

Given these challenges, it may be tempting to try to lure away a successful CIO from another institution. Before making an offer, though, keep in mind that perfection is relative, CIOs caution.

"You must match the goals of an organization and its culture with the goals and character of a CIO," Keever says. "These are places in which I would not be as successful as I would be at Penn [Health Systems]."

PREVENT DATA CARE

Nancy Earnley is a member of an elite group: health care information security officers. Their job is to ensure the privacy, confidentiality and security of individual patient and plan member health information held by hospitals, physician groups, health plans and indemnity insurers.

Just a few years ago, Earnley's job — corporate manager for confidentiality and data security at Partners HealthCare System, Inc. in Boston — was almost unheard of. Today, experts say only a few hundred health care security specialists are working actively nationwide. But within a few years, they say, most health care organizations of any size will need people like Earnley, which means potentially several thousand new positions.

A host of factors is pushing the mushrooming development of health care SWAT teams. A primary one is a sudden realization of the need for IS security strategies at hospitals, physician organizations and managed care organizations. As medical records go electronic, providers and payers share more and more clinical information across a wider group of users.

There's an increasing need for health care data security, but finding qualified people like Nancy Earnley is no easy task

By Mark Hagland

IT LIVES

Most of all, security specialists will be in great demand as the federal government moves toward implementing health information privacy, confidentiality and security regulations mandated by the Health Insurance Portability and Accountability Act (HIPAA) of 1996. It calls for criminal penalties and fines for violations of patient confidentiality (though specific sanctions haven't been codified).

Still, the need for people like Earnley doesn't mask a few distinct core challenges facing hires of security specialists. Finding qualified people is difficult, the job comes with a steep learning curve, resources and upper-management support are lacking, and the job description is ambiguous.

records department at Partners HealthCare. She works with a team of consultants to develop policies and procedures around enterprise system security. On almost a consulting level, she works with IS staff to develop rules of confidentiality as they begin to roll out a clinical data repository and longitudinal medical records. And she's involved in assessing the process for releasing patient records on request, which needs streamlining at Partners HealthCare, as elsewhere.

Another security specialist, Micki Krause, says there are three main components to her job. She is director of information security at Santa Ana, Calif.-based PacificCare Health Systems, a national health plan that joined after managing information security in the retail, manufacturing and aerospace fields.

She works with health plan and access control administrators on data access issues; manages and develops security policies and procedures; and works with IT staff to build security into the network, applications and operations. Though excited about her job, Krause says there's a lot to do, partly because health care is so far behind in IT and information security compared with the other industries she's worked in.

Interestingly, health information security officers don't cite technical issues as their biggest challenges. "The biggest challenge is to get all the stakeholders to understand what their responsibility is in supporting the security program," Krause says.

Earnley agrees. "In any other business, like banking or in an accounting department, you would not think twice about automating the accounts receivable process. But in hospitals, we have

Hiring Challenges

- **Qualified staff:** no obvious path for finding these people or determining who is qualified.
- **Progress delay:** organizational politics, lack of dedicated resources or commitment from the top and steep learning curve.
- **Job definition:** unclear whether it is policy development, operations implementation, assessment/analysis or a combination of all three.

to jump through a lot of hoops to justify the electronic medical record and the confidentiality and security that goes all around that," she says.

"Fortunately, Partners is . . . very supportive of patient confidentiality and security," Earnley says. It recognizes the extremely high potential for high-payout lawsuits if data is not properly secured, she adds.

Finding and holding on to good security managers is important, but it's expected to be a problem. The number of people with any qualifications is so small that it's really a seller's or job seeker's market.

In most cases, "new" health information security officers are being hired and developed internally, based on their institutional knowledge. But they tend to be kept at a department manager level. Pay also hovers at about that level, which varies across health care sectors and organizations but tends to run from about \$55,000 to \$75,000, depending on location as well as size and type of organization, experts say.

Though pay and job qualifications vary, certain qualities are essential for all security specialists. "The successful health information security officer has to be a patient advocate, someone who feels passionate about privacy and confidentiality. But [that person] also has to understand the technical aspects of how all this can be accomplished," Earnley says.

Highland is a freelance writer in Chicago.

To date, most security specialists are coming from two areas: Half are recruited from medical records, and most of the other half come from the IS department, according to Mary Brandt, a consultant at Seal Beach, Calif.-based Pyramid Health Solutions, a consulting firm that specializes in health information security. A few are from risk management.

Earnley comes from the medical

WHEN THE CHALLENGE IS CHANGE, THE SOLUTION IS L&Y

In partnership with over 1,500 health care organizations nationwide, Ernst & Young LLP is the premier professional services firm serving the health care industry. Ranked among the top 20 of PC World's 1999 Fast Track 500 List, we've taken knowledge sharing to a new level, leveraging intellectual resources organization-wide, while adding tremendous value to every client relationship. The result? Technical solutions for our health care clients of unparalleled depth and bottom-line impact. Therefore we need to attract individuals who have successfully provided business solutions through Information Technology.

We have on-going consulting opportunities throughout the nation for Consultants with a strong commitment to considerable travel. A Bachelor's degree is required (preferably in IS or HC Management Systems); experience as a consulting or professional services firm is a strong asset. Qualified candidates should have:

- Strategic information systems planning
- Health care-specific software knowledge (i.e. SMS, HBOC, EPIC, etc.)
- Enterprise systems applications (i.e. PeopleSoft, Lawson, SAP, etc.)
- Planning, implementation and installation of clinical and financial software packages
- Experience in developing and delivering IT infrastructures
- Knowledge of clinical repositories and computerized patient records (CPR)

We offer competitive salaries, flexible benefits and significant opportunities for personal and professional development. For consideration, forward your resume, indicating appropriate Dept. Code, to:

For Chicago and The Great Lakes: Dept. 18044
For Los Angeles and the West: Dept. 18046

For New York: Dept. 18045
For Atlanta: Dept. 18047

X-rays drive hospital upgrade

► Hospital puts new medical systems online

By Barb Cole-Gomelski

TRINITY MEDICAL CENTER recently installed a high-bandwidth network, but it isn't new applications that the hospital is making **NETWORK UPGRADE** room for. It is the increasingly digital hospital equipment — such as X-ray and heart-monitoring machines — that is eating up bandwidth.

Over time, those digital machines will let the Rock Island, Ill., health care provider create an integrated, electronic file of patient records available to anyone in the organization. The company is housed in three buildings and spread out over several miles.

Along the way, the digital devices running on an Asynchronous Transfer Mode network will help improve care and make it easier for health care professionals to do their jobs, said Will Weider, Trinity's chief information officer.

So critical was the network overhaul that it took precedent over the year 2000 project, which the hospital expects to complete soon.

"Our key strategy is to work with physicians to make their lives as easy as possible," Weider said. If doctors can pull up patient information quickly and even access it from home, it might help the hospital retain

good physicians, he said.

There is an archival issue, too. Although digital patient information takes up space on the network, it also frees up square footage in the facility. "Today, we spend a couple hundred thousand dollars a year on archiving," Weider said. As medical records go digital during the next few years, Weider said, he expects that the hospital

will eliminate those costs almost completely.

The hospital is also eyeing new applications, including a videoconferencing system to let Trinity's mental health professionals provide psychiatric services to rural facilities.

Still, the driving force behind installing the 3Com Corp. network was the networked med-

Testing Y2K on mirror site saves for exchange

By Thomas Hoffman

MOST ORGANIZATIONS that have already started testing their computer systems for year 2000 readiness have either set up a test environment with duplicate equipment or have partitioned off part of their mainframes for testing.

Those approaches were designed to keep businesses from shutting down production systems for testing. But buying or

leasing duplicate equipment can cost millions of dollars, and no matter how much money a company spends, test environments can never duplicate all the quirks of the production system.

Information technology professionals at the Philadelphia Stock Exchange think they have found an answer somewhere in the middle. For the past six months, the exchange has been

FedEx API tactic promising but risky

By David Ornstein

IF USERS in other markets follow the leaders in package delivery, the popular new way to interface with customers will be to distribute application programming interfaces (API) to internal business applications.

Federal Express Corp. earlier this month released a set of package tracking and shipping APIs that will link corporate networks, intranets and World Wide Web sites directly to internal FedEx applications that hold shipping status information. United Parcel Service of America, Inc. has been shipping its own Web APIs for more than a year and offers tools to integrate other systems as well.

Such tight links with customers' systems can make electronic commerce easier and

faster, said Michael W. Jones, FedEx's vice president of marketing for logistics and electronic commerce.

Meta Group, Inc. analyst Kup Martin said FedEx, UPS and

American Express Travel Services, which also has released APIs for travel booking, are forerunners of a coming trend in electronic commerce toward application integration.

But Martin cautioned that companies that release APIs with little technical support may face a back-

lash from users, and companies that implement the APIs face substantial costs if they choose to rip them out later. FedEx and UPS provide some technical support.

The newly launched Proflowers.com, Inc., an online flower retailer in La Jolla, Calif., is

FedEx's Michael W. Jones: Tight links with customers make electronic commerce easier

ONE STEP BEYOND.

Since I've joined Arthur Andersen Business Consulting, I've been involved in direct client interaction. But most satisfying was realizing early on that being very good at what I do for a living makes a visible, lasting impact on my clients' businesses. Arthur Andersen has made a big investment in me, constantly developing my skills and giving me all the tools I need to exceed my own expectations. In retrospect, my move to Arthur Andersen was less a leap of faith than a confident step forward—definitely a change for the better. THIS IS WHY I'M HERE.

Responsible for the implementation of packaged software systems in an integrated health delivery system, hospital, physicians' practice or managed care environment. In addition to the above requirements, consultants will be responsible for understanding and translating client requirements into a proposal format, providing project management for client engagements (bidding & staffing) and will possess general marketing skills with the ability to sell their own work.

Qualified candidates will have a bachelor's degree, MBA is a plus. Excellent customer service and interpersonal skills are a must. This person will have very heavy client interaction. Position involves 50% travel.

Knowledge of one or more of the following software packages a plus:

Unisys enterprise-class solutions for Windows NT
deliver security, power, and control.
No matter how many
different systems you're running

Put Unisys Single Point Security in a complex heterogeneous environment and you'll have the power to control your entire system from a central location anywhere on the network. Need increased security? Advanced external authentication tokens requiring smart cards and biometric scans are available to validate users before allowing them access. Unisys Single Point Security is just one of many ways Unisys delivers secure enterprise-class NT environments. It's why Microsoft has teamed up with us to create the Unisys/Microsoft Enterprise Partnership—an alliance designed to help customers capitalize on NT as an anchor for highly secure solutions. Stop by our Web site to find out more.

UNISYS

Testing Y2K on mirror site saves for exchange

CONTINUED FROM PAGE 48

testing production data that's mirrored in real time to a remote Sungard Data Systems, Inc. disaster recovery facility.

The EMC Corp. Symmetrix Remote Data Facility the stock exchange has been using since September 1996 makes it possible to test the systems for procedures such as executions of stock trades as they are being processed.

That means the exchange doesn't have to simulate such tests at night or on weekends.

And because the exchange already owns the duplicate IBM OS/390 environment housed at Sungard, it is "saving millions of dollars" because it doesn't need to buy duplicate test equipment, said Frank Reidy, a first vice president at the stock exchange, which is being acquired by the National Association of Securities Dealers in Washington.

Part of the exchange's cost savings stems from the fact that it doesn't have to pay year 2000 team members to work nights or weekends, said Reidy, who wouldn't say how much the mirroring service costs.

And the stock exchange doesn't pay extra for the test time because testing uses system time that is already paid for, said a spokesman for Wayne, Pa.-based Sungard. The exchange is the only Sungard client using the system in this way.

Still, Reidy acknowledged that the use of the Sungard/EMC mirrored environment for year 2000 purposes "was a nonplanned type of thing." The exchange became a beta-test site for the Sungard/EMC service in 1996.

Stephanie Moore, a year 2000 analyst at Giga Information Group in Westport, Conn., said she has clients who are renting space from Sungard and Rosemont, Ill.-based Comdisco, Inc. to run millennium tests.

"But I haven't come across anyone" who is testing applications against mir-

rored, real-time production data in those environments, she added.

With more weekday hours to test remediated code, the exchange has been able to test 60% of its mission-critical systems and put them back into production, said Bruce Smith, chairman of the exchange's year 2000 task force.

That puts the exchange on schedule to get the rest of its systems fixed and re-entered by year's end so that it can devote all of next year to industrywide testing among brokers, clearinghouses, and other stock exchanges, Smith added. □

Hospital upgrade

CONTINUED FROM PAGE 48

ical equipment. For instance, Trinity is installing new monitoring machines that will be used to conduct sleep studies. "It's all PC-based, and the studies are digitized," Weider said. "There's a tremendous advantage to being able to send that information anywhere on the network."

The movement to digital medical equipment will force a lot of hospitals to consider network upgrades, said Deborah Kohn, a principal at DAK Systems Consulting in San Mateo, Calif. "But it may not be their biggest priority because they are so preoccupied with year 2000 projects," she said.

Gail Arnett, executive director of the College of Healthcare Information Management Executives Foundation in Ann Arbor, Mich., agreed that larger facilities are likely to face network upgrades. However, she said it is likely to be less of an issue at single-site hospitals that don't need to share patient information across expansive campuses. □

But what about your enterprise?

Find out everything you need to know about implementing Unisys enterprise-class solutions for Windows NT.*

Like when to choose scalability over clustering. And how to cost effectively manage a heterogeneous network.

FedEx API tactic promising, risky

CONTINUED FROM PAGE 45

bating its whole business on a custom system linked to FedEx's APIs, said Proflowers President Bill Strausz.

FLOWER POWER

Once a customer has ordered a bouquet, Proflowers retrieves shipping information, including a bar code from FedEx. The bar code is automatically fused to a flower grower. The grower puts the flowers in a FedEx box with the bar code visible, and the flowers are sent. Customers can track the order from the Proflowers site or read E-mail updates.

And tying into UPS's system lets

MWI Veterinary Supply Co. in Nampa, Idaho, respond more quickly to customers because tracking information appears on the green-screen terminals of its telemarketers, said Steve Nelson, the \$100 million firm's operations director.

But Duncan Van Duern, vice president at Brielle Executive Gifts in Brielle, N.J., said his company has declined the chance to hook up with UPS because customers wanted features such as better catalog searches, not UPS tracking, he said.

"If we're going to go through that kind of pain, we want to see a real home run for our customers," Van Duern said. □

Keeping up with Starr

► Sites struggled, but met crush of report traffic

By Sharon Machlis

How do you handle your biggest-ever World Wide Web traffic surge?

Information technology executives who wrestled with the crush of people seeking the Starr report said it was another in a string of valuable, on-the-job Internet lessons.

"I would say we learned a great deal under that kind of stress ... that is difficult to

duplicate in a laboratory," said Jan Vaine, director of business development and administration at CBS Corp. in New York. At the CBS News Web site, traffic loads occasionally were 100 times higher than anything the site had experienced before when the report was released on Sept. 11.

"Not all spikes are the same," noted Monty Mullig, vice president for Internet technology at Cable News Network (CNN) in

Atlanta. "You need instruments on all the places where resources are likely to become scarce."

Sometimes bottlenecks result from server-computer power that can't handle the load. In other cases, the limit may be bandwidth-related — as was the case with the 445-page Starr report.

Although the file itself was only about 450K bytes, a D53 line (at 44M bit/sec.) handles roughly 155 downloads at a time, Mullig said. If each user downloaded the whole report, thousands of others couldn't get through. One solution, used by many sites posting the report: break up the file into smaller pieces, of roughly 40K bytes each to let more people gain access at the outset.

CNN also kept its advertising up by using a sister site to serve up ads, preventing a further drain on its resources.

Major news sites typically strip down their main pages when a hot story breaks. That not only cuts needed bandwidth because large graphics files are gone, but also eases server load by cutting down the number of objects on the page. Each Hypertext Markup Language (HTML) object requires a separate "hit" to the server.

"We gradually reduce the weight of our page as we see it coming," Mullig said. At the height of the Starr report traffic, CNN's home page was only 35K bytes — the usual is 150K bytes — and the usual two dozen Starr, page 50

This sign outside Allen's Computer Cafe in Upper Merionville, Md., beckoned Web surfers inside for an online look at Kenneth Starr's scathing report on President Clinton's conduct.

Tool pushes corporate data

► Tibco products automate info updates

By Johanna Ambrosio

TIBCO, INC. is getting pushy. Again.

With two new products, the vendor is jumping on what it said is the next wave of push technology — taking corporate data out

of systems management and other behind-the-scenes products and pushing the information to users' desktops.

Last year's first wave — pushing customized information, such as reports on favorite sports teams' scores to end users — didn't fare well because users were overwhelmed,

and the technology overtaxed most networks. The new technology allows, for example, salespeople to subscribe to information about pricing changes, new service and support options and earnings reports about their own companies or prospect accounts. A sales manager could also request alerts when any order more than \$500,000 arrives from any of the U.S.

Unlike traditional reporting tools, Tibco's don't require users to initiate the reports, said product manager Tim Hickman. However, the Tibco tools don't let users query on their own: users still need traditional reporting and data-access tools to

Home Depot makes Java a fixture

By Carol Sliva

MANY COMPANIES merely dabble in Java, but The Home Depot, Inc. has made a strong commitment to the 3-year-old programming language and the Common Object Request Broker Architecture (CORBA) for distributed computing.

The Atlanta-based retailer eventually hopes to have all of its 650 to 400 in-house programmers using Java, which was created by Sun Microsystems, Inc. Right now, 130 have been trained, and 60 are active Java developers, according to Home Depot's Mike Anderson, vice president of information services. "I'm hoping [Java] lives for 10 to 15 years," Anderson said. "That's our goal."

Fourteen months ago, Home Depot turned to Java with the following goals in mind: to write applications that can run across multiple platforms, inter-

Wireless Exchange

San Mateo, Calif.-based Corsoft Corp. has announced Alleron 1.0, a tiny, wireless Microsoft Corp. Exchange client designed for two-way paging devices such as Motorola, Inc.'s PageWriter 2000. It lets users retrieve Outlook data, such as E-mail, tasks, calendars, contacts and notes, from any location. They can transmit faxes and text messages using third-party software. Information is secure because it is stored on the Exchange server rather than the paging device. Pricing starts at \$499 per unit. It will be available next month.

Electronic routing

Ottawa-based JetForm Corp. has announced FormFlow 99, an upgrade to its workflow software that will let users route electronic forms to any browser-enabled desktop. Priced at \$7,500 for 100 users, it will be available Oct. 31.

Keeping up with Starr

• Sites struggled, but met crush of report traffic

By Sharon Machlis

now to you handle your biggest-ever World Wide Web traffic surge?

Information technology executives who wrestled with the crush of people seeking the Starr report said it was another in a string of valuable, on-the-job Internet lessons.

"I would say we learned a great deal under that kind of stress ... that is difficult to

duplicate in a laboratory," said Jean Vaine, director of business development and administration at CBS Corp. in New York. At the CBS News Web site, traffic loads occasionally were 100 times higher than anything the site had experienced before when the report was released on Sept. 11.

"Not all spikes are the same," noted Monty Mullig, vice president of Internet technology at Cable News Network (CNN) in

Atlanta. "You need instruments on all the places where resources are likely to become scarce."

Sometimes bottlenecks result from server-compute power that can't handle the load. In other cases, the limit may be bandwidth related — as was the case with the 443-page Starr report.

Although the file itself was only about 450K bytes, a DSL line (at 44M bit/sec.) handles roughly 155 downloads at a time, Mullig said. If each user downloaded the whole report, thousands of others couldn't get through. One solution, used by many sites posting the report, was to break up the file into smaller pieces, of roughly 40K bytes each to let more people gain access at the outset.

CNN also kept its advertising up by using a sister site to write up ads, preventing a further drain on its resources.

Major news sites typically strip down their main pages when a hot story breaks. That not only cuts needed bandwidth because large graphics files are gone, but also eases server load by cutting down the number of objects on the page. Each Hypertext Markup Language (HTML) object requires a separate "hit" to the server.

"We gradually reduce the weight of our page as we see it coming," Mullig said. At the height of the Starr report traffic, CNN's home page was only 21K bytes — the usual is 150K bytes — and the usual two dozen

objects were trimmed to two. CBS switched from dynamic HTML to "flat" HTML, reducing system load by eliminating direct calls to an Oracle database, and attempted to reconfigure some systems on the fly.

QUERY BACKUP

Yet another potential bottleneck comes from database queries, either within the same organization or from a server via the Internet.

"If you're linking to other sites, make sure you buffer that," said John Nick, technical director at MSNBC, a joint venture between National Broadcasting Corp. and Microsoft Corp. "You don't want your site to go down because your queries, to another site are backed up."

Instead, a separate server could be performing those

queries, while the Web server then gets the latest available results. Another option: Older information can be cached until updates are available.

For the U.S. government sites used as "official" posting areas for the Starr report, "there's not a lot you can do when you've only got a day's notice or so," said Herbert Becker, director of information technology services at the Library of Congress.

Becker decided to use a separate, more powerful server to

handle the Starr report. Nevertheless, a system that typically deals with 9 million transactions per month was somewhat overwhelmed by 3.9 million in one day, with many connection attempts failing on the Friday afternoon that the report was released.

The Internet Traffic Report, published by Andover.Net in Acton, Mass., estimated that packet loss at the site topped 80% during the worst periods of the Internet crash. □

Home Depot, Java

CONTINUED FROM PAGE A9

operate with applications written in other languages and let all of its programmers develop in the same language and leverage off the same infrastructure. Despite some early hurdles, Home Depot is finding that Java is working as planned. The company has at least three key Java applications running:

■ A Virtual District Office that allows district managers to view store-performance reports, which are presented in Hypertext Markup Language through World Wide Web browsers.

■ A customer service form that lets the company rent out trucks to customers using a graphically oriented Java application to fill out the contract. Novera Software, Inc.'s Business application server sits in the middle tier.

■ An Employment Application Kiosk that lets a prospective employer watch a video, take a test and fill out an employment form through a Java application. Managers can access resumes

and even activate employees through the Java application.

Home Depot programmers break up the code into a thin presentation layer on the client, putting business logic in the middle tier and data access objects on the back end, Anderson said.

Although other companies have been hesitant to take the plunge, Home Depot embraced CORBA for its distributed computing environment because it runs on all the operating systems Home Depot uses: Unix, Windows NT and mainframes.

"With Java, you get the ability to move an application from one platform to another, but by using CORBA as the middle-ware provider, what you also get is the ability for an application on any platform to communicate with any other application on any other platform," said Tim Sloane, an analyst at Boston-based Aberdeen Group, Inc. "Through the Interface Definition Language, CORBA allowed us to have a Java object call a C object or a C object call a C object," Anderson said. "[So] we could leverage off of legacy code."

Not surprisingly, building applications using the still-developing Java hasn't been without obstacles. With its Employment Application Kiosk program, Home Depot developers had to write their own transaction initiator in C/C++ on the mainframe and develop their own drivers for touch-screen and electronic-signature capture because there was none available, Anderson said.

Home Depot developers also had to tinker with applications to improve performance because they don't run at the same speed on Microsoft Corp.'s Windows NT, Hewlett-Packard Co.'s Unix or IBM's OS/390 and AIX.

"Different implementations of the Java virtual machine [that compiles the Java code] is where the problem lies," Anderson said. "It's different response times across different operating systems. It makes us have to reengineer a little bit in order to get the performance the way we need it to be."

On the whole, Java's benefits outweigh the risks. Developers can concentrate on the business logic, and their Java applications can be distributed easier via a central server, he said. □

Corporate data being pushed to desktop

CONTINUED FROM PAGE A9

explore data in corporate systems.

Adaptex Corp., the maker of I/O boards and other related products, is testing Event-Console and ContentBroker.

The company has created channels for information re-

lated to sales, competitive business information and technology trends, according to Douglas Phan, director of information technology and architecture.

"We picked applications we felt would give us a competitive edge and a rapid return on investment," Phan said.

PERSONAL CHOICE

The idea is to let employees subscribe to information they want, whether it is about pricing changes on Adaptex products, information about the I/O marketplace or technology trends about Microsoft Corp. products, for example.

"People have the ability to control the information they want to get," Phan said. So far, the pilot projects are proceeding without any major glitches, he said, and his company remains happy with its choice.

Tibco's new products are called TIB/EventConsole, which notified users according to preset boundaries, and TIB/ContentBroker, which collects information from software packages, including those from The Baa Co., Clarify, Inc., PeopleSoft, Inc. and SAP AG.

Tibco also is working on pro-

viding links to other software packages, including Oracle Corp. applications, Hickman said.

A component called the Channel Manager lets a webmaster or other technically savvy person add or create channels for users' desktops.

Channels are the onscreen windows for specific categories of pushed information.

Pricing starts at \$75 per client and \$45,000 per server.

Tibco's additions compete with some products already on the market from BackWeb Technologies and Wall Data, Inc.,

said Maureen Fleming, an analyst at Gartner Group, Inc. in Stamford, Conn.

"Generally, enterprises are looking to gain access to internal systems. This is an emerging area that accounts for less than \$10 million in revenue so far, she said.

The overall trend fits into what Gartner calls the "zero-latency enterprise," Fleming said. That's when a company adopts a "series of strategies to reduce the time it takes to capture information and make it available and actionable," she said. □

NEW PRODUCT

ADOBE SYSTEMS, INC. has announced PageMill 3.0 for Macintosh, software for World Wide Web page authoring, site management and Web graphics editing.

According to the San Jose, Calif., company, new features include multimedia drag-and-drop capabilities as well as enhanced support for frames, fonts, and colors.

It ships with thousands of Web templates, graphics and animations and also can check for errors such as broken Web links and spelling errors.

PageMill 3.0 for Macintosh costs \$99.

More viruses come in the mail

► Infection rates rise, but so do defenses

By Laura DiDiio

WATCH OUT for malicious code hiding in your E-mail.

The number of viruses that infect systems and networks via E-mail has jumped dramatically in the past two years. Conversely, the more traditional sources of viral infections — such as diskettes, computer games and shareware — are on the decline, according to the International Computer Security Association. Inc.'s (ICSA) just-released 1998

Virus Prevalence Survey.

The ICSA survey of 300 large and midsize businesses — which encompassed 581,000 PCs — showed that the overall number of viral infections was up 48% from last year. This year's ICSA study showed that users experienced 86.5 virus infections per 1,000 PCs, compared with 62.5 viral infections in last year's survey.

FOREWARNED, FOREWARNED

The good news, though, is that users are increasingly arming themselves against the threat. This year, 98% of the responsi-

ing businesses reported they have antivirus packages installed on their PCs — an increase from 73% last year.

This shows that companies are taking the virus threat seriously," said Larry Bridwell, president, page 55

Users doubt copier/E-mail combo

► Xerox pushes 'copier portal' to online world

By Roberta Fusaro

EARLIER THIS MONTH, Xerox Corp. and IBM's Lotus Development Corp. announced a bundling deal and new technology that could let users scan, route, fax and mail documents using their copiers.

On Sept. 8, the two announced Lotus software that

would let users scan documents using Xerox Document Centre copiers and output them, not on paper, but into the Notes E-mail format or a Dominoes World Wide Web server repository.

The copiers already let users print, fax and copy documents from their desktops. With the new software, which has yet to be named, they will be able to

scan hard copies into electronic formats or output documents directly as E-mail. Scanned documents can be stored as images, or the system can convert them to live text using Xerox's TextBridge optical character recognition software, according to Xerox.

This is the first of several initiatives various copier makers will launch to integrate their Copiers, page 54

ManageWise too much for small users

By Gerrit Michael Hayes

THE RELEASE of ManageWise Version 2.6 last month is another brick in Novell, Inc.'s effort to strengthen its market foundations. ManageWise may indeed be part of an effective strategy to drive any market shift away from NetWare with new features such as improved NetWare Directory Services monitoring, traffic analysis and inventory management.

However, there is little in the product to help drive NetWare into new markets, and implementation flaws in features such as remote monitoring and control mean that deployment should be carefully tended.

Key to the technical strategy behind ManageWise is the Simple Network Management Protocol (SNMP) standard. SNMP allows a management station, in this case the ManageWise Console, to both query devices and control some or all of the devices' behavior. Both the query and control functions require an "agent" (either application software or embedded firmware) on every device to be managed.

First, our install server-based ManageWise, page 54

Net adapter cards add reliability

By Bob Wallace

AN EMERGING class of network adapter cards and software is providing users with long-sought-after redundancy and throughput boosts for their expensive and mission-critical servers.

Products from major players and newcomers alike use a fail-over capability to quickly redirect traffic from an inoperative adapter to a live one. They also balance traffic over multiple cards to increase overall server performance.

With the adapter cards and software, which cost about \$1,000 per server, information systems managers can ensure that the failure of a \$100 adapter card doesn't cripple a server that costs tens of thousands of dollars.

"What drove me to implement was that we had a couple of adapter cards go bad in Adapter cards, page 54

Users doubt copier/E-mail combo

► Xerox pushes 'copier portal' to online world

By Robert Fuxano

EARLIER THIS month, Xerox Corp. and IBM's Lotus Development Corp. announced a bundling deal and new technology that could let users scan, route, fax and mail documents using their copiers.

On Sept. 8, the two announced Lotus software that

would let users scan documents using Xerox Document Centre copiers and output them, not on paper, but into the Notes E-mail format or a Domino.doc World Wide Web server repository.

The copiers already let users print, fax and copy documents from their desktops. With the new software, which has yet to be named, they will be able to

scan hard copies into electronic formats or output documents directly as E-mail. Scanned documents can be stored as images, or the system can convert them to live text using Xerox's TextBridge optical character recognition software, according to Xerox.

This is the first of several initiatives various copier makers will launch to integrate their

Copiers, page 54

ManageWise too much for small users

By Garrett Michel Hayes

THE RELEASE of ManageWise Version 2.6 last month in yet another brick in Novell, Inc.'s effort to strengthen its market foundations. ManageWise may indeed be part of an effective strategy to show any market shift away from NetWare with new features such as improved NetWare Directory Services monitoring, traffic analysis and inventory management.

However, there is little in the product to help drive NetWare into new markets, and implementation flaws in features such as remote monitoring and control mean that deployment should be carefully tended.

Key to the technical strategy behind ManageWise is the Simple Network Management Protocol (SNMP) standard. SNMP allows a management station, in this case the ManageWise Console, to both query devices and control some or all of the devices' behavior. Both the query and control functions require an "agent" (either application software or embedded firmware) on every device to be managed.

First, you install server-based ManageWise, page 54

PRODUCT REVIEW

► ManageWise 2.6

NOVELL, INC.

Provo, Utah

Price: Starts at \$-995 for five-user license

Pros: Good automatic network maps and customizable views; useful remote management tools

Cons: Details keyed to users more than workstations; low default on safety levels with remote management tools

Net adapter cards add reliability

By Bob Wallace

AN INTERING class of network adapter cards and software is providing users with long-sought-after redundancy and throughput boosts for their expensive and mission-critical servers.

Products from major players and newcomers alike use a fail-over capability to quickly redirect traffic from an inoperative adapter to a live one. They also balance traffic over multiple cards to increase overall server performance.

With the adapter cards and software, which cost about \$1,000 per server, information systems managers can ensure that the failure of a \$100 adapter card doesn't cripple a server that costs tens of thousands of dollars.

"What drove me to implement was that we had a couple of adapter cards go bad in

Adapter cards, page 54

An IBM Company

Adapter cards add reliability

CONTINUED FROM PAGE 31

servers and didn't want that to happen again," said Steve Marshall, systems engineer at Imperial Credit Industries, Inc. in Torrance, Calif. The company is considering upgrading to two \$45,000 servers and believes that paying less than \$1,000 each for protection is a wise investment.

"It's not an intelligent choice not to do it. It's not worth taking the risk," Marshall said.

DOWNTIME COSTLY

Imperial runs its general ledger applications on two \$40,000 Compaq Computer Corp. servers that are accessed internally and over a wide-area network by four of its subsidiaries, Marshall said.

"I have to make sure that the servers are available from 7 a.m. to 7 p.m. Losing them for any [substantial] amount of time could be detrimental to the company," he said.

Vendors began shipping the new breed of adapter cards and software around the beginning of this year, with Intel Corp., Sun Microsystems, Inc. and Compaq among the players, said David Paul Lightner, an analyst at Dataquest in San Jose, Calif.

"They will have a version by the end of the year," he predicted.

Server load-balancing products

What they are:

Adapter cards and related software that enable users to balance traffic over multiple network interface cards in their servers

Benefits:

- Eliminate a single point of failure by providing redundancy
- Eliminate bandwidth bottlenecks to improve throughput

Some of the major players:

Compaq, Intel, IP Matrix, NSI Software, Sun Microsystems

Two more companies — IP Matrix and NSI Software, Inc. — early this year started shipping server software that works with any adapter card, Lightner added.

The New York Mayor's Office went with the software primarily to eliminate a single point of failure in its NT servers, which cost from \$30,000 to \$40,000 apiece. It also was pleased to experience a big performance boost from load balancing.

PERFORMANCE BOOST

"We needed fail-over software for our servers so that if one adapter blows up, traffic is shifted to the next one," said Ping Chou, LAN administrator at the mayor's office. Adding a second adapter card and IP Matrix's load-balancing software boosted performance by 30% to 40%, he said.

Most users buy the advanced adapter cards or software for redundancy, Lightner said. "Fail-over functionality is most important because it's a safety net. Load balancing helps performance but is an added value," he said.

Nonetheless, Bradley Carroll, systems programmer-LAN at food wholesaler Richfood Holdings, Inc. in Richmond, Va., is looking to the products to help provide bigger pipes to his company's NT servers.

"We need bandwidth relief because our print servers are getting beaten up with all the jobs coming in," he said.

Richfood Holdings now uses one 16M, bit/sec. Token Ring adapter per server and plans to go with two that support 32M bit/sec. each per server to solve the congestion problem. Carroll said. □

ManageWise review

CONTINUED FROM PAGE 51

components on a NetWare server running IntramixWare 4.1 (in my case running on a Dell Optiplex Go+) The installation added several NetWare Loadable Modules (NLM) to the system in a process that most NetWare administrators can do in their sleep. Support for NetWare 5.0, to be released later this year, is also included in ManageWise 2.6.

Next, you load the software for the management console onto a workstation running either Windows 95 or 98 or Windows NT Workstation 3.51 or 4.0. I loaded the console applications onto a Hewlett-Packard Kayak workstation, running Windows NT Workstation 4.0.

After installation, the first difficulty cropped up. As with several other products in Novell's line, you must follow a lengthy list of configuration steps to put ManageWise 2.6 into service. I would have preferred an interactive process rather than having to follow instructions.

Once I completed the fairly complex setup, a set of NLMs called NetExplorer immediately began gathering information about the test network based on the contents of TCP/IP traffic. The ManageWise Console software, which runs on the NT workstation, used this information to build a graphical image of the network, to which I could quickly add detailed information such as physical location of the equipment, primary user and contacts names.

Every system communicating on the local Ethernet network segment appeared in the diagram, although the NLMs gathered almost no system details beyond the IP address before the next step of the installation, loading the client software.

As I began logging users in to the NetWare server, the ManageWise system began automatically loading the SNMP agent software onto each workstation. This software then gathered detailed information about the workstation and transmitted it to the inventory database. The detailed information was extremely complete, down to the level of variables set in the workstation's operating system.

One flaw I found in this process was that the database entries for each system were recorded under the name of the logged-on user rather than the host or system name assigned to the workstation itself. That is

a serious limitation when dealing with roving users or shared workstations. There was no obvious way to address it.

ManageWise loads utilities at each workstation, letting the administrator both monitor and control actions on the workstation. Though this is undoubtedly useful in many, if not most, network environments, I found serious flaws in how Novell has implemented these features.

One notable problem is that the remote control agent, as installed by default, lets an administrator lock on to and either view or control a workstation with only a time, almost unnoticeable indicator at the bottom of the user's screen. During my testing, an administrator drove another user nearly to distraction by causing applications to misbehave.

LOST DATA

However, even more troubling was the feature letting an administrator reboot a remote workstation. Clearly useful in many situations, this tool not only gave no notice to the workstation user, but it also rebooted the station without properly saving applications first. I was astounded to find.

An application that holds changes in memory simply loses unsaved data. That was true even though an application would normally have recovered that same data had the workstation simply crashed.

Because of this, administrators will need to be even more careful to control access to key systems in their environments as well as take appropriate steps to alter default settings for some segments and user groups.

Being able to easily snoop into or disrupt systems in areas such as accounting or the executive wing isn't likely to be appreciated as a leap forward in network management.

ManageWise 2.6 contains several useful refinements that will certainly make it worth adopting in organizations with many NetWare systems in place. Smaller organizations — those with only one or two servers and a few workstations — will find the product overkill. □

Users doubt copier/E-mail combo

CONTINUED FROM PAGE 51

products with proprietary mail packages such as Lotus Notes and Microsoft Corp.'s Exchange, according to Kevin Kmetz, a research manager at Framingham, Mass.-based International Data Corp. (IDC).

The result will be more choices for users, he said. IDC is a sister company to Computerworld.

DIGITAL ADVANTAGE

Xerox is seeking to take advantage of advancing digital technology in the printer market by offering users a "copier portal" from which they can access and manage both print and electronic documents.

IBM, meanwhile, is trying to find another marketing avenue for Notes, selling it to Xerox users to help compete with Exchange, which is increasing in

market share, said analyst Barry Tepper at Norwell, Mass.-based Cap Ventures, Inc.

What could be more telling long term, according to analysts, is that some time next year both vendors will support the Standard Architecture, an open standard that lets multifunction devices, scanners, printers and fax machines communicate.

The protocol is widely used in Europe but has been slow to catch on in the U.S.

Solution would be particularly valuable to remote employees who need to print, fax and access documents on the road, analysts said.

Charles Jeffers, information technology manager at the Atlanta Convention & Visitors Bureau in Atlanta, uses Xerox's Document Centre 265ST printer

to create proposals.

But Jeffers said his organization uses mostly Microsoft products, including Exchange, so he would prefer that the Xerox integration be with Office software.

Rich Bethart, president of Bethart Printing Services in Hamilton, Ohio, said his company recently added a Document Centre 265ST printer to its stable because digital printers mean quicker turnaround. But he isn't interested in linking it to E-mail.

"We're print for pay. These features sound like they are designed more for my customers," he said. Bethart said his company would consider the hardware/software bundle, but the answer capabilities would have to be decent because the machines aren't cheap. □

More viruses come in the mail

CONTINUED FROM PAGE 51:

uct development manager at ICISA headquarters in Carlisle, Pa. "That's good news, because the virus code itself is becoming more malicious. The upside is that the antivirus vendor community is responding much more quickly. Once a virus hits the streets, a fix is usually posted within a couple of days."

Users responding to the latest ICISA survey also indicated that the rate of viral penetrations — most frequently macro viruses — via E-mail now account for 32% of all new infections, Bridwell said.

Also, the newest viruses contain more malicious code with the potential to do more damage to systems, he said.

Diskettes remain the most common source of infection — 68% of the survey's users traced their viruses to diskettes — but E-mail is gaining rapidly. In the 1996 ICISA Virus Prevalence Survey, only 9% of viruses were transmitted via E-mail; that figure tripled to 27% last year and

rose again to 32% in the latest survey.

"We expect this trend to continue because more and more businesses are transferring data via E-mail — and [via] multiple E-mail and groupware packages at that," Bridwell said.

Phillip Carden, a security analyst at The Renaissance Worldwide, Inc., a Hoboken, N.J., consultancy, said the only thing that surprised him about the ICISA's findings was that "the percentage and number of companies that traced E-mail as the source of their viruses wasn't higher than 32%."

Carden added that he believes that, though viruses hiding in E-mail messages will continue to pose a big prob-

lem, fewer businesses should be plagued by viruses invading their systems via diskettes.

"There's a popular misconception that any type of contact between the PC and infected diskette can result in downloading the virus, but that's not true," Carden said. "In fact, it's actually getting harder to transmit viruses via diskette because you have to boot the machine while the diskette is installed." □

NEW PRODUCTS

LANANT CORP. has announced the FTH1220 and the FTH4230, Ethernet hubs with 12 and 24 ports.

According to the Needham, Mass., company, the hubs have an internal 10/100 switch designed to help Ethernet-based networks transition from 100M bit/sec. to 100MB bit/sec. speeds.

The FTH1220 costs \$995, and the FTH4230 costs \$1,595.

Briefs

Oracle sales sink

Oracle Corp., in Redwood Shores, Calif., has announced a tentative version of its Oracle Sales and Marketing application that lets salespeople access information on a handheld organizer using the PalmPilot platform. Future releases will support other handheld devices such as those using the Windows CE platform, Oracle said. Pricing wasn't disclosed. Oracle also has announced no online services for salespeople and has featured for Oracle Internet Community Server 3.0 and Oracle Web Customer 3.0. The service, Oracle Field Sales Online, was designed to let salespeople use it to monitor to account sales information, Oracle officials said.

Collaboration software

San Francisco-based Cyber Corp. has launched Bluewin ABC, internet-based collaboration software for the architecture, engineering and construction industries that lets multiple users post, review and discuss project documents online. Comments can be threaded chronologically, marked up, tracked and archived, which benefits accountability among project managers, officials said. The service fits with a similarly secure collaboration. The service costs by per project per month for unlimited users.

Analysis may help retailer end slump

Service Merchandise's Danny Schunk: "We hung in there by a thread" during the store's years-long downturn

► Service Merchandise uses OLAP tools to target customers, markets and regain footing

By Stewart Dock

IN THE 1970s, the catalog showroom retail concept was hot. Customers could look at dozens of product models and compare them. But in the late '80s, when discount stores began to offer lower prices by stocking only a few models, catalog showrooms went bust.

And companies such as Service Merchandise Co. didn't know enough about their customers' buying habits or how to precisely target marketing campaigns to help them react quickly enough to change the downward slide.

NAMING ON
"We hung in there by a thread," said Danny Schunk, assistant vice president of merchandising and logistics systems at the Brentwood, Tenn.-based company. "Our sales and profit trends declined the last six to seven

years to the point where something had to change." Last year alone, Service Merchandise closed 43 of its more than 150 U.S. stores.

At the crux of the trouble were the chain's retail concept and a lack of detailed customer purchasing and marketing data.

Historically, the chain came out with a single catalog per

year, which meant it had to carry all the products in the catalog at the same prices all year, even if the products didn't sell. And it couldn't track the effect of specific marketing campaigns or fully understand geographic market differences.

Because Service Merchandise already has compiled a 500GB data warehouse in an Informix Corp.-based system, it now is attempting to analyze its way out of trouble, using tools from Intrepid Systems, **Baltimore, page 18**

The trouble was the store's retail concept and a lack of detailed customer purchasing and marketing data.

Integrating with R/3 can be hard on users

By Craig Steadman

FOR SAP R/3 users, the devil is often in the integration.

Tying other applications to SAP AG's market-leading enterprise resource planning (ERP) software remains a potential minefield for users, despite attempts by SAP and other vendors to reduce the integration complexities.

For example, Church & Dwight Co. had a mixed experience when the time came to hook several custom and third-party applications to R/3 for an installation of the software that went live in the spring.

The Princeton, N.J., company, which makes Arm & Hammer baking soda, was able to lean on software developed by Acta Technology, Inc. in Palo Alto, Calif., to automatically move transaction records from R/3 to a new data mart that is used to prepare daily sales reports for executives.

The ActaLink tool generated the required procedural code on its own, freeing Church

Vendors back R/3

► Announce services to aid implementation

By Michael Goldberg
Los Angeles

EVERYONE, IT SEEMS, has hopped on the product and service bandwagon to help businesses implement SAP AG's business process software.

The players making announcements at Sapphire '98 here last week included traditional systems integrators, such as the big accounting and consulting firms and vendors, for instance, PC market power Dell Computer Corp.

Dell announced it would open an SAP R/3 center of expertise next month in Austin, Texas, and install R/3 enterprise

resource planning software on its Windows NT-based PowerEdge servers so users could buy the servers already configured.

Among the announcements were the following:

- Federal Express Corp. was slated to demonstrate the first in a planned series of products linked to R/3. FedEx Express Bridge links the company's shipping and package tracking capabilities with R/3.
- The consulting subsidiary of KPMG Peat Marwick LLP announced an alliance to cooperate on marketing, sales, training and implementation efforts for R/3-related accounting

projects related to joint business ventures.

■ IntelliCorp, Inc., a maker of modeling products for packaged applications, unveiled InterFace 7.2, a new version of its software that lets users share R/3 data with other applications. Earlier this year, IntelliCorp acquired the product, previously called UPI, from Deloitte & Touche LLP.

■ And Siemens/Nixdorf Information Systems, Inc. said it is going to enter into the R/3 outsourcing business. Company officials said the U.S.-based unit of the German conglomerate would sell its own experience as an R/3 user as a service provider.

The company plans to introduce maintenance contracts that could allow customers to pay for service needed — five days per month, for example. □

Visual Basic

CONTINUED FROM PAGE 37

developers to buy add-ins if they want the platform and data source independence of Common Object Request Broker Architecture (CORBA) component technology.

Working with a late beta of the Enterprise version, I built a couple of trial applications, including a more complex one that linked to an Oracle R/3 database, in less than an hour. (The final version is now shipping, but I was unable to test it by press time.) The Enterprise Edition differs from the Professional Edition by including team development, distributed computing features and Visual Component Manager, an integrated component repository.

Microsoft, continuing its embrace of all things Internet, includes two new tools to aid in building Web-based applications: Web-based Information Server (WIS) and dynamic Hypertext Markup Language (HTML) technologies. Those new features give developers increased control of performance and scalability. Version 6.0 requires Windows 95, 98 or NT 4.0 with Service Pack 3 or later.

For example, IIS applications do most of their processing on the server. As a result, IIS projects should work with any browser. By separating out the presentation layer, developers can better control business logic, enhance runtime performance and, possibly, reduce coding time. Finally, IIS projects produce Web-class objects, which resist reverse engineering and code modification.

Dynamic HTML applications execute most of their code on the client system, which provides more opportunity for rich presentations, including multimedia elements. One caution: Dynamic HTML's custom tags are supported only by Microsoft's own Internet Explorer, so that project type is best used on intranets where you have full control of the client's browser.

DATABASE ACCESS

Version 5.0 includes ActiveX Data Objects, a more mature version of the Remote Data Objects introduced in Version 5.0. The ActiveX Data Objects accelerate connections to structured and unstructured database records and even nonrelational sources. For example, you can access Oracle7 and Oracle8 databases running on NT, Unix and MVS, overcoming one of Version 5.0's limitations.

Version 6.0 still forces developers to buy third-party add-ins for CORBA

Version 5.0 Enterprise also includes OLE DB drivers for Microsoft's SQL Server 6.5 and later, Oracle3.0 and later, Microsoft Access, Open Database Connectivity data sources and Microsoft's SNA Server. But keep in mind that OLE DB drivers generally run slower than native drivers. Development groups that want a wider range of connectivity options should consider Microsoft's Visual Studio, a collection of traditional client/server, Web-oriented and Java development and deployment tools. It includes Visual Basic 6.0.

Microsoft made only minor changes under the hood. Compiled applications require Version 6.0's runtime library and appear to execute faster, thanks to a new optimize-at-runtime feature. But the largest gain in efficiency and convenience accrues to developers of Web-based projects. For them, this upgrade makes good sense. □

Millman operates Data System Service Group LLC, a consultancy in Croton, N.Y. His E-mail address is hmillman@dsi.net.

SAP issues

CONTINUED FROM PAGE 37

on the other side of the link is upgraded.

But Church & Dwight didn't get off to easy with two third-party applications that had to be tied to R/3. For one of them — a package that tracks discounts given to retailers for in-store promotions — an automated R/3 interface was still just a gleam in the eye of the software developer, Pensis said.

An interface to R/3 was available for the other application, Managistics, Inc.'s supply-chain planning software, which Church & Dwight already was using. But Pensis said the Managistics interface was designed to continually shuttle data on a real-time basis, which didn't mesh well with the company's batch transfer orders. That resulted in data integrity problems at the Managistics end of the line, he said.

Church & Dwight "literally spent months" trying to get the interface to work, Pensis said. Finally, it assigned an on-site consultant to write a custom link, which took another eight weeks to develop.

During the past two years, SAP has released hundreds of applications programming interfaces that are supposed to shield R/3 users from having to write ABAP code. That number will increase to almost 1,000 when R/3 4.5 becomes generally available next year, SAP executives said.

But even the programming interfaces don't fully hide the complexity of tying other applications to R/3, said David Dobson, an analyst at Benchmark Partners, Inc. in Cambridge, Mass. Users "often minimize the difficulty," he said. "But they're going to spend a lot of time on this. People do it for a living."

GATX Capital Corp. looked integration in the eye and decided to just stay away from it

as much as possible, said Michael Cromar, chief financial officer at the San Francisco-based asset management firm. Instead of tying in other applications, GATX is doing almost all of its business processing inside R/3.

"We replaced about 25 systems with SAP, and the goal was to simplify our life," Cromar said. "We like the idea of having all our data in one place so we don't have to synchronize it between different systems." The only interface work done by GATX involved hooking some Excel and Notes applications that track leases to R/3, which Cromar described as relatively painless.

ABAP itself wasn't the issue: GATX wrote more than 4,000 printed pages of ABAP code to modify R/3 for equipment leasing uses, and Cromar said the SAP language wasn't too onerous. What GATX didn't like was the idea of having to maintain multiple application environments outside of R/3, he said. □

Retailer

CONTINUED FROM PAGE 37

Inc. in Alameda, Calif.

The retailer uses Intrepid's DecisionMaster, a \$500,000 national online analytical processing tool, to create custom reports that find patterns in sales and inventory by region, store and individual items.

The company now can track marketing campaigns such as the coupon-lier carried in recent Sunday newspapers that

asks buyers to "discover the new Service Merchandise."

The company had insights circulated in 70% of its markets and will analyze each market response. "Now we can dig into the data about the markets that didn't respond to the coupons and highlight where it didn't work. We can then adjust our campaigns, redesign our fliers or get out of newspaper inserts in that market," Schunk said. He added that if more stores need to be closed, that type of tool would help the chain to determine which

specific stores underperform, rather than closing all the stores in a region.

TREND CATCHING

Mitch Kramer, an analyst at Patricia Seybold Group in Boston, said consolidating customer information also lets retailers run predictive modeling. "They can use that information to manage marketing campaigns, change products or change the way they treat you as a customer," Kramer said.

"When we recognize trends we can act much faster," said

Michael Presley, Service Merchandise's director of buying and inventory management. "Before we had this in place, we had to do it all by ad hoc [database] requests, which were limited and slow." Presley now can transfer chunks of data to his own spreadsheets and manipulate it as much as he wants.

Whole new analytic worlds have opened for Presley with the ability to look at data for individual stores, items, product classes and supply vendors.

"I have more data now than I ever imagined," Presley said. □

(20X FASTER SQL FOR TRANSACTION PROCESSING)

A new Caché customer recently switched 1400 users from Sybase and reports average SQL performance gains in transaction processing applications of 20X on the same hardware, with no changes to the application.

Briefs

Flight-time services

Aerobird Corp. and Fujitsu Ltd. have demonstrated an eight-way server based on Intel Corp.'s Pentium processor. The server, which can support up to 16G bytes of memory and 216G bytes of internal storage, uses Fujitsu's Synchrotron technology to fit two four-way server into a single three-rack system that runs Windows NT.

Separately, Data General Corp., in Waltham, Mass., has announced a 1000-server-to-a-box configuration that can support up to 11 Windows NT servers in a single box. The company also has announced a new version of its Cluster-to-a-box configuration, then with two quad-processor Xeon servers tied together in a high-reliability configuration with supporting management software.

Summing E-in LCDs

Summing Electronics Co. has announced plans to launch production of its active-matrix, 19-in. LCD screens for notebooks to 20,000 units per month by year's end. Summing said 15.5-in. displays will become mainstream starting early next year and that more users in the future will opt for 14.5- and 19-in. models. Smaller Taiwan-based laptop makers have already rolled out models featuring the larger screens, but Summing says it has kept together windows from launching models with 19-in. panels.

Higher chip demand

Chasing stronger-than-expected demand for all of its products, especially in North America and Europe, Intel Corp. has raised its third-quarter revenue expectations upward. It said it expects its revenue to rise 8% to 10% from the second quarter. Its July Intel conference investors that third-quarter revenue would be flat to slightly up from second-quarter revenue.

Downed by the Asia-Pacific region, including Japan, is meeting Intel's expectations.

• Users struggle with TCO models

Complex costs evade control

By April Jacobs

ALTHOUGH USERS are more than a little interested in stretching their IT dollars, actually reducing costs and accurately measuring them is fairly difficult, research shows. And the greatest unknown in any project—managing risk—can be one of the biggest cost factors.

At least that's what Boston-based Aberdeen Group, Inc. concluded in a recent report that bucked the conventional wisdom emerging over the past

two years regarding total cost of ownership (TCO), namely that it can be measured with a fair degree of accuracy [CW, Sept. 14].

Measuring TCO refers to the concept of assessing and being able to predict the complete cost of acquiring and maintaining one's information technology infrastructure. The conventional wisdom has

The conventional wisdom has been that companies can reliably identify TCO factors.

been that companies can reliably identify those costs, which include everything from acquisition of equipment to support, maintenance and service.

Analysts said building a model that can accurately reflect costs is almost prohibitively difficult, but it can be done by including the following techniques and tools:

- Identifying risk factors.
- Carefully assessing core technology for risk factors.
- Standardizing hardware and software.
- Automating distribution and upgrades of applications and operating systems.
- Assessing service and maintenance delivery.

For example, at Tulsa, Okla.-based Commercial Financial Services, Inc., Chief Information Officer Chris Horrocks said he doesn't focus on TCO when

TCO, page 62

Synchronization software has reaped "phenomenal savings" for global shipping line Maersk, says Jeffrey Irvinski, general manager of sales processes.

System lets carrier slash dial-up costs

By Matt Hamblen

SYNCHRONIZATION software has enabled global shipping line Maersk, Inc., to cut its dial-up time and costs because sales personnel spend less time online swapping customer data in their laptops with corporate servers in Madison, N.J.

After one year with the new system from Synchrologic, Inc. in Atlanta, Maersk officials said the company's communications costs, including time spent

by sales representatives, have dropped from \$286,000 per year to less than \$14,000 per year. Instead of spending an average of two hours per week online, each of the 233 sales representatives who use laptops can get daily data updates in two to three minutes.

And bandwidth demand on the phone line has been cut by more than 90%, Maersk and Synchrologic officials said.

More important than the dial-up costs, page 62

Reliability counts in RAID

By Nancy Dillon

A SOON-TO-BE-RELEASED survey of 250 Fortune 1,500 storage managers reveals that the most important purchase criterion for Windows NT-based RAID arrays is reliability.

Purchase cost is just the eighth most important factor (see chart).

"Sure, reliability is first," said Kim Ross, chief information officer at Nielsen Media Research, a New York-based television ratings company. "It's the key thing you're looking for from RAID."

But Ross said that after reliability,

he would rate serviceability second and purchase cost third. He said he isn't as concerned with software bells and whistles on his 500G bytes of Windows NT-based RAID.

"There's a lot of difference out there with serviceability," he said. "You've got to look at how easy it is to repair a failed unit, how disruptive disk replacement is to the NT domain. If E-mail has to go down, that's a big deal."

In general, "the research proves that users are really demanding midrange RAID functionality for the commodity. Reliability, page 62

Carrier slashes dial-up costs

CONTINUED FROM PAGE A1

time and network savings, sales representatives get daily updates with capacity and pricing data to help them compete for shipping contracts that would fill ocean-going freight liners and swell revenue, said Jeffrey Irvinski, Maersk's general manager of sales processes.

"Before this system, reps spent a lot of time just getting a report ready to send. While this is still a growing system, it's definitely [reaped] phenomenal savings," Irvinski said.

Maersk's unit management was "somewhat skeptical at first when we were talking about a system costing close to \$1 million," but with the current level of savings, that amount will be paid off in two more years, he said.

Currently, the shipping industry is regulated so that its

Synchronization software is the kind of technology that will separate the big-league lines from the plain-vanilla ones.

— James Winchester, Lazard Freres

sales representatives can't offer lower prices if space suddenly opens in a ship's hold when another customer changes plans and ships fewer goods. But with deregulation of U.S.-regulated lines coming from Congress within a year, "things will change drastically, and thus synchronization software will be unbelievably beneficial," Irvinski said.

For example, if a large amount of shipping capacity suddenly opened up on a freighter traveling from Singa-

pore to San Francisco, a Maersk sales representative could reduce the price of the space to take another competitor, he said.

EFFECTS OF DEREGULATION
"Deregulation of container shipping will open up a whole new need for this type of real-time global management system for helping set ship capacity and pricing," said James Winchester, an analyst at Lazard Freres & Co. in New York. "It's the kind of technology that will separate the big-league lines from the plain-vanilla ones."

Maersk worked with an integrator to hire Synchrologic to install data synchronization software for about \$800,000. The software allows sales representatives to change data on a chart containing a customer's request, but the software manages what is sent and what is returned so that only new information travels over a phone line, analysts say.

The market for the Synchro-

logic software is "not a large one today but conceptually could be," said Ken Delaney, an analyst at Gartner Group, Inc. in San Jose, Calif. He said Synchrologic customizes the interconnections among mobile users and a variety of databases, something unique among vendors that usually provide software to link with their own databases.

Synchrologic's software works with a homegrown application at Maersk called the Global Access Marketing Plan, Irvinski said. When a sales representative is offline, the software holds the data on a server, and the data can be quickly distributed to a mobile user once a connection is made.

Though the benefits are great, Irvinski said it has taken users some getting used to. "The hardest part is that it's such a complicated system," he said. "The salespeople definitely see the benefits [with access to more and current data], but we're trying to simplify things."

Because so much data is available now, Maersk underestimated the size of hard drives that sales managers would need. It thought they would receive only one-fifth of the 10M bytes they download every day from as many as 30 sales personnel each. Maersk currently uses 16- to 32-Mbyte hard drives in 2- to 4-year-old laptops and will soon upgrade to new machines with more storage, although the amount hasn't been decided. □

Reliability counts

CONTINUED FROM PAGE A1

oriented NT server environment," said Tom Lahive, an analyst at Dataquest in Westboro, Mass., the research firm that executed the study.

Two high-end storage vendors, known best for their mainframe and midrange products, have weighed in on those user demands in recent weeks.

Storage Technology Corp. in Louisville, Colo., announced that its 9353 RAID array for NT clusters, which was released in March, now lets users add disk capacity, change RAID levels and tune performance while the array is operational.

And Sun Microsystems, Inc. in Mountain View, Calif., announced that the StorEdge A1000 array for workgroups and the StorEdge A3500 array for online transaction processing would gain NT support in November. The StorEdge A3500 Fibre Channel array for data warehousing, as well as Sun's tape libraries, are slated to gain NT support by year's end.

INTRIGUED

The Sun announcement interests Evan Benrubi, a vice president of systems and technology at Transamerica Intellitech, a real estate subsidiary of San Francisco-based Transamerica Corp. That's because he likes his mainframe-attached A7000, Sun's largest array, which already combines NT, Unix and mainframe support.

"An A7000 [at \$35,000 to \$70,000] is more cost-effective than an A7000 [at \$256,000 to \$1.9 million], but I wouldn't want to get one without NT support," Benrubi said. "Out in Sacramento [Calif.], we're creating a large NT database, and combining disparate systems under one hardware environment is our ultimate goal."

Sun's NT announcements are "good," but the company needs to solidify its multipatform initiative, said Anders Lofgren, an analyst at Cambridge, Mass.-based Giga Information Group. "[Sun is] supporting Solaris on everything, and now they've added NT," he said. "But what about the other remaining environments?"

Sun officials said there are no immediate plans to add other Unix platform support to the A7000, A3500 and A5000 arrays. □

Cutting TCO

CONTINUED FROM PAGE A1

implementing projects. He said the company's rapid growth and need to accommodate business needs are more important. But the company doesn't consider extravagance a good thing, either, and wants to make sure that IT is implemented to work optimally.

Commercial Financial Services processes thousands of calls and transactions per day, Horrocks said, and has one of the largest SQL Server databases in the world.

To develop the system without any major hiccup, which would have meant lots of wasted time and resulted in huge labor costs, the company installed a simulation lab to manage its risk up front. It used that lab to test each system and upgrade before it went real-time, Horrocks said.

SEEKING CLEARLY NOW

"This has allowed us to get a very clear view of application execution times and configuration capacities—much more clearly than with theoretical numbers. It was a very positive thing to do, and enormous delays have been avoided because of this," he said.

But that isn't the only type of cost.

According to the Aberdeen study, users also need to know their vendors and understand

the supply/service relationship so that they know exactly what they are getting in any type of package deal, which might include hardware, software and service.

Taking anything for granted could prove costly and disastrous, a fact not lost on the CIO of a large Southwestern bank, which recently had to begin replacing several thousand PCs after it discovered they weren't year 2000-compliant.

Replacing those PCs, said the CIO, who asked to remain anonymous, is a good example of how unknown factors can turn project costs upside down, making an accurate cost assessment difficult to perfect from the outset.

In research it completed two years ago on TCO, Stamford, Conn.-based Gartner Group, Inc. also stressed that it isn't enough to simply use tools, such as Microsoft Corp.'s Zero Administration for Windows, that were designed to simplify desktop management and reduce TCO. According to Vaughn Frick, an analyst at Gartner, users have to understand how they can use such tools to actually address TCO issues within their companies.

For example, using an asset management tool to track hardware and software isn't very useful unless it is used to develop a standard set of hardware and software to simplify support issues and thus reduce labor costs, Frick said. □

NEW PRODUCTS

EMABYTE CORP. has announced the EZty, a tape storage autoloader for workgroup servers or remote sites.

According to the Fountains, Ala., company, the Ultra Wide SCSI system can be configured with single or double 350- or 400-MHz Pentium II processors.

The 50 SL has 64M bytes of memory and 750 bytes of disk storage. The 800 SL offers 64M bytes of memory and up to 144G bytes of internal RAID storage.

Both server has a graphics accelerator and support for PCI 133/100 BusT networking.

The 50 SL price starts at \$1,900.

The 800 SL price starts at \$1,900.

For more information, call (800) 770-4400 or visit www.intelgroup.com.

Data Mining Solution

Instead of just storing customer data, give your decision makers the *whole* story.

There are a million stories in your customer data—and they're all ready to be sold. With the SAS Data Mining Solution, you can provide your sales force, department managers, and other decision makers with the tools they need to gain true business knowledge.

Which prospects are hot? Or not? Which target groups need to be ignited...or simply delighted? The answers are revealed with the SAS Data Mining Solution. It's the only software that spans every facet of the data mining process, delivering ease of use and analytical depth in a single package—one that draws directly from the award-winning SAS Data Warehouse.

Just point and click. Decision makers don't have to be statisticians, or database experts, to convert very large amounts of data into immediate competitive advantage. To find out more, including real-world success stories and an interactive demo of the SAS Data Mining Solution, visit us at www.sas.com/datamining

Briefs

OLAP server integrates

Business Objects SA has made its query and reporting tools work with several popular online analytical processing (OLAP) server databases, including Hyperion Solutions Corp.'s Embase 5.0, IBM's Data OLAP Server 1.0, Informatica Corp.'s InfoCube 4.0 and Oracle Corp.'s Essbase Server 5.1. Prices vary by configuration. The company plans to add integration with Microsoft Corp.'s forthcoming SQL Server 7.0 OLAP Services in the next release of Business Objects, which is scheduled to go into beta testing by year's end.

Support adds R/3 link

Sageant Technology, Inc. plans to ship by year's end DirectLink for SAP, which lets users extract SAP AG for input into their data marts for reporting and analysis.

DirectLink uses a graphical menu-driven browser to render SAP tables in a more comprehensible form. The automated conversion eliminates the need for writing extraction codes. Pricing hasn't been set.

NCR buys retail market

NCR Corp. has bought a controlling interest in Sterling Douglas Group, Inc. in an effort to expand its data warehousing offerings for retailers. Sterling Douglas makes the Profit Sense software, used to forecast and replenish merchandise for NCR's Teradata database platform and other operating systems.

NCR bought 50% of Sterling Douglas for an undisclosed amount. It will continue to operate as an independent software provider, NCR officials said.

Microsoft goes parallel

Microsoft, Inc. has released the Merge/Purge Parallel option for its iDCenter database system. The new option supports as many as 30 processors simultaneously, running on any Unix, Windows 95/NT or Windows NT platform. Pricing was unavailable.

Data mart users try, try again

By Tony Bacr

WHEN DOW CHEMICAL CO. completed its multiyear SAP migration in 1995, it discovered the project wasn't really done. So Dow began to build an enterprise reporting system, which today numbers 25 data marts, using Cognos, Inc.'s PowerPlay online analytical processing (OLAP) cubes.

"Once we had global codes and a globally integrated enterprise platform in place, we recognized and planned ahead for analytical reporting," said Mike Costa, global controller for business reporting and analysis at Midland, Mich.-based Dow.

The marts have paid for themselves in less than a year

because their self-service reporting let Dow reduce its information technology reporting staff from 40 to five people. Nearly a quarter of the company's desktop users access the marts. But most important, the marts are helping Dow answer competitive questions such as how to best tune its supply chain.

SYSTEM DESIGN

The key to success was treating the marts with the same degree of planning and user-needs analysis as in the enterprise resource planning (ERP) project, Costa said.

But not everybody gets it right the first time. Most organizations usually redo the database and data-model and query-environment architectures because their inexperience with

transaction systems often causes them to first use approaches that don't work well in data warehousing.

For example, when Stanford

University in Palo Alto, Calif., built its first data mart five years ago for the finance department, it didn't realize that it eventually

data mart, page 69

ERP, warehouse used in concert

► Burton Snowboards forecasts sales with SAP

By Lisa Kempton

FOR BURTON SNOWBOARDS in Burlington, Vt., the nation's largest seller of snowboards—a key element of maintaining profitability depends on managing the extreme seasonality of its business. Any miscalculation of the inventory, material management or placements means the company's margins take a hit.

Burton Snowboards' Justin Whittington and Jennifer Minciar need an ERP system that forecasts sales accurately

Burton uses the enterprise resource planning (ERP) system from SAP AG to compare sales against forecasts by country, region and area. Using the insights gained from that knowledge, the company adjusts its production and shipping. The faster ERP executives can spot a problem, the more likely the company can fix it.

But Burton doesn't rely on an ERP system alone. The company

included a data warehouse and a management reporting platform based on Oracle Corp.'s Express Server online analytical processing (OLAP) database engine into its planning system to more

tightly control its inventory. The company migrates information every night from the SAP system into its data warehouse and then uses Vista/EA, a management reporting tool from Research and Planning, Inc. in Cambridge, Mass., to view the data.

ERP, warehouse unite, page 69

COMMENTARY

Beware dirty data

SHAKU ATRE

"This is the fourth in a series on how to build a data warehouse. The previous installment appeared in our Aug. 24 issue.

Legacy data is inevitably in worse condition than you realize. And I'm not just talking about relatively simple data anomalies caused by things such as typographical errors, spelling variations and changing area codes. You are likely to run into

problems such as incompatible data formats, codes that no one can decipher, data that's embedded in long text fields, over-

lapping customer records from multiple systems—some with redundant data and others with conflicting or outdated data—and even chunks of mystery data of long-forgotten provenance and uncertain ownership.

Dirty data, page 69

highly available systems prove to be investments, not a cost

► In the 1980s and early 1990s, businesses had two main ways to solve their IS availability problems: For one, they could use the best available standard products and hope for the best. With this option, the burden of providing a highly available solution fell on the shoulders of the IS staff, and it was not a very predictable solution. Or they could buy a tightly integrated solution from a vendor such as Tandem. In the late 1980s and early 1990s,

Tandem defined fault-tolerant computing, with its tightly integrated NonStop operating system, interconnect technology, and Himalaya and Integrity

series of servers. With its high-volume transaction processing systems, Tandem became firmly entrenched in markets that require 100% uptime, including OLTP-intensive environments such as banking, financial services and telecommunications.

(Despite attempts by most major systems vendors, only one other company—Stratus—managed to become a viable contender for true fault-tolerant systems. However, the new generation of cluster-based, so-called highly available (HA) system offerings includes cost-effective alternatives such as Windows NT Server.)

The use of more reliable systems to support computing workloads from file/print serving to sophisticated OLTP networks and data warehouse environments is growing. Many businesses must provide 7x24 access to computing resources in support of multinational operations. Just a few years

ago, establishing an HA system environment to provide users with functions such as e-mail or groupware would have been considered overkill. But today, while e-mail or groupware applications may not have the same priority as OLTP networks or electronic funds transfer systems, the dependence of businesses on these functions is rising dramatically.

In today's business environment, the cost of any outage is substantial. The cost of ownership for tightly integrated, robust systems that protect completely against any computing disruption is often less than the costs associated with an outage for most OLTP-intensive IS environments. Such costs include labor, lost opportunities, loss of goodwill in the marketplace, and the loss of previously satisfied customers to competitors. An example of this last cost occurred ten years ago when AT&T's phone service suffered a major disruption. Companies like MCI used this to lure customers away from AT&T, eroding its then-dominant market position.

The difficulty of providing seamless failover increases with the complexity of a computing environment and applications. Providing what appears to be 100% uptime on a file

server used 12 hours a day six days a week is clearly easier than providing the same efficiency for an online reservation system used 24 hours a day seven days a week.

Ranking HA systems

Continuously available systems consist of hardware and software designed to protect against component- and system-level failures. The complexity and cost of these solutions depend on the types of services provided, the number of users, and the users' perception of an acceptable (vs. unacceptable) service outage.

IDC created its Availability Spectrum to sort out the marketing statements coming from vendors. Rather than wading through the differing vendor claims of HA, fault tolerance or continuous availability, the Spectrum shows four availability levels with attributes defined by the impact on a priority user and the system protection features. IDC uses the term "highly available" to encompass systems from all vendors that claim HA. Fault tolerance or continuous availability as part of their marketing strategy for a product.

This approach ranks solutions by the amount of disruption for the pri-

ority user versus comparing hardware and software features. Another factor that determines a solution's slot in the spectrum is the degree of operator intervention, i.e., whether the recovery process is partially or fully automated. The test for placing solutions in the spectrum is based on pass/fail functional criteria.

While ranking HA solutions is based on the impact to priority users, there are other important factors.

- Hardware redundancy needs to be included in power supplies, I/O ports, CPUs, disks, network adapters and physical networks. This redundancy eliminates any single point of failure within the hardware platform. If there is a failure in the hardware running a critical application, a duplicate component is available to ensure that the application has the resources to execute.

- Environmental safeguards protect a system from environmental hazards that can disrupt a critical application. Most current systems include some protection from power surges and short power outages, while uninterruptible power supply (UPS) systems can be installed to provide operation during an extended power outage. If the application is very critical, other forms of protection can be applied.

Availability Level 2 (AL 2) 99.9% available	User interrupted, can quickly reestablish session; may have to rerun some transactions from journal file; may experience performance degradation.	User work transferred to standby component; multiple system access to disks.
Availability Level 1 (AL 1)	Work stops; uncontrolled shutdown; data integrity assured.	Disk mirroring or RAID and log-based or journal file system for identification and recovery of incomplete in-flight transactions.

Source: International Data Corp.

ago, establishing an HA system environment to provide users with functions such as e-mail or groupware, would have been considered overkill. But today, while e-mail or groupware applications may not have the same priority as OHP networks or electronic funds transfer systems, the dependence of businesses on these functions is growing dramatically.

In today's business environment, the cost of any outage is substantial. The cost of ownership for tightly integrated, robust systems that protect completely against any computing disruption is often less than the costs associated with an outage for most OHP-intensive environments. Such costs include labor, lost opportunities, loss of goodwill in the marketplace, and the loss of previously satisfied customers to competitors. An example of this last cost occurred ten years ago when AT&T's phone service suffered a major disruption. Companies like MCI used this to lure customers away from AT&T, ending its then-dominant market position.

The difficulty of providing seamless failover increases with the complexity of a computing environment and applications. Providing what appears to be 100% uptime on a file

server used 12 hours a day six days a week is clearly easier than providing the same efficiency for an online reservation system used 24 hours a day seven days a week.

Ranking HA systems

Continuously available systems consist of hardware and software designed to protect against component- and system-level failures. The complexity and cost of these solutions depend on the types of services provided, the number of users, and the users' perception of an acceptable (vs. unacceptable) service outage.

IDC created its Availability Spectrum to sort out the marketing statements coming from vendors. Rather than wading through the differing vendor claims of HA, fault tolerance, or continuous availability, the Spectrum shows four availability levels with attributes defined by the impact on a priority user and the system protection features. IDC uses the term "highly available" to encompass systems from all vendors that claim HA, fault tolerance or continuous availability as part of their marketing strategy for a product.

This approach ranks solutions by the amount of disruption for the pri-

ority user versus comparing hardware and software features. Another factor that determines a solution's slot in the spectrum is the degree of operator intervention, i.e., whether the recovery process is partially or fully automated. The test for placing solutions in the spectrum is based on pass/fail functional criteria.

While ranking HA solutions is based on the impact to priority users, there are other important factors.

- Hardware redundancy needs to be included in power supplies, I/O ports, CPUs, disks, network adapters and physical networks. This redundancy eliminates any single point of failure within the hardware platform. If there is a failure in the hardware running a critical application, a duplicate component is available to ensure that the application has the resources to execute.

- Environmental safeguards protect a system from environmental hazards that can disrupt a critical application. Most current systems include some protection from power surges and short power outages, while uninterruptible power supply (UPS) systems can be installed to provide operation during an extended power outage. If the application is very critical, other forms of protection can be applied.

Availability Level	Impact on a Priority User upon Failure of Any Component	System Protection Features
Availability Level 3 (AL 3) 99.9% available	Users stay online; current transaction may need restarting; may experience performance degradation.	Automatic fail-over transfers user session and workload to backup components; multiple system connections to disks.
Availability Level 2 (AL 2) 99.9% available	User interrupted, can quickly reestablish session; may have to rerun some transactions from journal file; may experience performance degradation.	User work transferred to backup components; multiple system access to disks.
Availability Level 1 (AL 1)	Work stops; uncontrolled shutdown; data integrity ensured.	Disk mirroring or RAID and log-based or journal file system for identification and recovery of incomplete in-flight transactions.

► Many cluster products allow the inclusion of SMP nodes as cluster members, and users get the best of both worlds: low-cost performance increases with enhanced availability.

* In a cluster configuration, multiple systems are coupled to share computing workloads and resources such as applications, communications and/or access to data. In an HA clustered system, a number of systems or nodes operate independently. Each runs its own copy of the operating system and applications with at least two nodes having access to shared data. If one system node fails, another inherits the storage devices, user workload and applications of the failed node. Downtime is the time required by the backup to inherit workload, resources and users of the failed node and restart any failed applications.

HA cluster systems have different availability characteristics than symmetric multiprocessors, or SMPs. If the purpose in adding CPUs is to increase the ability of the systems to do more work, the least costly option is to add another processor in the same backplane (if the platform supports multi-

processors and isn't already at maximum capacity). But this solution does not eliminate single points of failure. If a processor in an SMP fails, the operating system crashes, and during the reboot the failed processor will be configured out. When an SMP crashes, work stops. The additional processor allows the reboot to occur quickly.

If a processor fails in a cluster of the same processing power, the cluster still continues to operate. Today, many cluster products allow the inclusion of SMP nodes as cluster members, and users get the best of both worlds: low-cost performance increases with enhanced availability.

Enabling software

Enabling software includes enhanced or modified operating environments, middleware, messaging software and RDBMSs. In addition to the older, proprietary systems, most of

Dynamics of the highly available systems market

The highly available systems market is defined by the AL 2 through AL 4 categories in IDC's availability spectrum. The worldwide market's growth from \$11.8 billion in 1995 to \$16.6 billion in 1997 represents a compound annual growth rate (CAGR) of just under 15%. By contrast, the 8% CAGR for the overall server market in this

same period highlights the increasing demand for highly available solutions. From 1997 to 2002, the projected CAGR in the highly available systems market is 15%, versus 8% for the overall server market.

Demand is being driven by users' growing dependence on all aspects of business supported by an underlying computing resource.

The expansion of business transactions generated by electronic commerce coming from the Internet is expected to fuel further growth in highly available systems.

Leaders in the highly available systems market as of year-end 1997 are reflected in the total HA and individual AL 2 through AL 4 figures (see pie charts below).

Factory Revenue Market Share
Leaders AL 4: 1997

Factory Revenue Market Share
Leaders AL 3: 1997

Factory Revenue Market Share
Leaders AL 2: 1997

today's HA systems are Unix-based. Software enabling high availability includes NCR's Lifekeeper FRS, IBM's HACMP, Seratun's ISIS and Digital's TrueCluster as well as TP monitors such as TopEnd, Tuxedo and Encina.

Higher-end AL 4 providers once required the use of proprietary hardware and operating systems or highly specialized versions of Unix—a requirement that kept users of AL 4 systems from taking advantage of off-the-shelf industry-standard software. However, demand from users to run off-the-shelf software on highly available systems is growing.

The promise of running shrink-wrapped software on an HA system platform is driven by the demand created by the announcements of platforms running Windows NT Server. Notable was the partnership among Tandem, Microsoft and Compaq, in late 1995, to deliver an open Windows NT clustering environment providing AL 2 solutions, followed by AL 3 and possibly AL 4 solutions over time. A key component to providing this clustering capability is the Tandem-developed ServerNet interconnect technology. Last year's Compaq/Tandem merger further solidified the relationship with Microsoft and provided additional focus toward enhancing Windows NT Server clustering capabilities.

The initial release of Windows NT Server, which was designed to provide additional clustering capability (originally code-named Wolfpack), fell short of original expectations. The announcement of NT Server Enterprise Edition provided only two-node failover capability instead of the four-node support that many customers expected. Customers were also disappointed in the product's ability to provide failover for the operating system and underlying hardware platform without the same capability for the major application (Exchange) they were looking for.

The distinction between systems designed for failover versus takeover is determined by implementation. A sys-

tem designed to failover to another similarly configured environment is usually achieved through software and management practices. Establishing failover scenarios and practices requires intervention by IS personnel and therefore is prone to human error. True fault-tolerant systems are implemented with multiple system components running in lock-step, so that in the event of a failure, the remaining component will seamlessly take over operations with little or no performance degradation.

As the marketplace matures, some of the more cost-effective features now found only on higher-end systems will become requirements or options (e.g., mirroring disk software, RAID arrays and dual I/O ports). Users purchasing servers today should ensure that their systems will grow with them, not only in increasing computing power and storage capacity but also in capability for modification to increasing availability requirements.

As with any high-growth market, the HA systems market will, after a period of sustained growth, undergo consolidation. This consolidation will coincide with the institution of HA system standards for interconnection devices, software and hardware components, allowing users to cluster an increasing number of (legacy) systems. The ability to incorporate existing (perhaps even heterogeneous) systems into an HA system cluster will make loosely clustered HA systems an attractive choice for users.

Cost justification

Which system solution a customer chooses to support a specific application or workload is based primarily on

the business cost of the loss of that application. On an OLTP network supporting airline reservations or electronic funds transfer systems, the cost of workload interruptions is easily quantifiable. Most users supporting these application types employ AL 4 solutions, which virtually eliminate service disruption. AL 4 solutions are typically referred to as fault-tolerant and are most notably produced by Stratus and Compaq/Tandem. While many vendors are beginning to offer AL 4 solutions, the track record of these two establishes their leadership position.

AL 4 systems impact a purchaser's pocketbook significantly more than AL 1 through AL 3 products. However, if even a few minutes of planned or unplanned system outages per year would cost more than the difference in price between an AL 1 through AL 3 system and a high-end fault-tolerant solution, the purchase of an AL 4 system should be automatic.

Customers should perform a detailed risk analysis for any application or workload being considered for protection under some level of HA solution. Once a cost analysis has been done, the cost of an outage will often go a long way toward justifying the additional price of the solution. In many instances the financial loss incurred by even a single outage will more than justify the price of such a solution.

About the author

► The demand for "continuous availability" applies to a larger sector of business applications than ever.

Ten years ago, fault-tolerant, high-availability computing was a niche market, albeit a vital one, that included business-critical applications such as ATMs, stock trading and emergency services. For these and other critical applications, 24 x 7 wasn't just a goal; it was a necessity.

by Keith Wlooth

zero downtime: user fantasy becomes reality

A lot has changed in the past decade. High-availability computing is now in the mainstream. Today's emerging Internet and intranet

applications, driven by the concomitant revolutions of electronic busi-

ness and direct customer communications, have clear-cut requirements for continuous availability. End users

and customers, weaned on 24-hour ATMs and payment card authorization systems, have come to expect zero downtime.

Until recently, the promise of 99.9% availability was accepted by most businesses. But today, there are many applications whose requirements are not met by 99.9% availability, including:

- ◆ ATM transactions, point-of-sale transactions and electronic funds transfers
- ◆ Computer-aided dispatch
- ◆ Electronic business
- ◆ Internet banking
- ◆ Travel and reservation systems
- ◆ Patient services

Businesses that depend on continuously available systems cannot settle for 99.9%. For applications in which constant customer accessibility is crucial, the fault-tolerant NonStop® Himalaya® server

Real-world Availability: Outage Minutes/Year

solutions are designed to provide well beyond 99.99% availability. The Tandem Division of Compaq Computer Corp. calls it "continuous availability."

Continuous availability is the reason that NonStop Himalaya continues to be the leading platform in industries where zero downtime is a baseline requirement. Point in fact: NonStop systems handle more than 90% of the world's securities transactions, 66% of the credit card transactions and 80% of all ATM transactions. In addition, they are used by 35 of the world's largest telecommunications companies.

But the need for continuous availability goes beyond these business sectors. Every organization today must weigh the impact of downtime in terms of lost revenue and lost customer confidence, then evaluate the need to increase the availability of its systems. According to the Standish Group, a research advisory firm in Dennis, Mass., 60% of the mission-critical applications in production will be operating 24 hours a day, seven days per week by the year 2000. In the chart below, Standish Group shows the impact of downtime, in terms of outage cost per minute, for

Outage Cost Per Minute

ten business-critical applications.

The NonStop Himalaya line from Compaq is truly capable of zero downtime. The NonStop part of its name is well-deserved. One U.S. stock exchange that relies on NonStop Himalaya solutions has had no downtime in 18 years. None. Not for maintenance. Not for software upgrades. Not even to add more processors or storage. Absolutely no downtime at all.

Setting the standard

As the leader in continuous availability for more than 20 years, the Tandem Division has continually set the standard against which availability solutions are measured. And, since Compaq completed its merger with Tandem, the company has invested considerably in R&D for the NonStop Himalaya platform, as well as in the NonStop architecture. "Himalaya is a key part of Compaq's enterprise strategy," says John Rose, senior vice president of Compaq's Enterprise Computing Group. "We've expanded that strategy to anchor the very high end for the most demanding organizations around NonStop Himalaya."

Compaq's strategy for enterprise computing, which is called the E2000 Platform Architecture, enables organizations to implement standards-based products for building IT infrastructures that can be leveraged well into the next century. (Readers can learn more about this strategy by going to www.compaq.com/products/servers/e2000/index.html.) Components of Compaq's E2000 Platform Architecture include ProLiant servers, Fibre Channel-based storage products and ServerNet interconnects.

User outage minutes and relative availability

strategy originated within the Tandem Division. For example, the ServerNet interconnect, which is used to create Windows NT Server clusters, is based on high-speed redundant routing technology that is core to the NonStop Himalaya architecture. And Microsoft Cluster Server software (MSCS, formerly known as Wolf-pack), which enables multiple

ProLiant Servers to function as a Windows NT Server cluster, is a system-level messaging infrastructure for which Tandem provided technology based on the Himalaya architecture.

NonStop architecture features like these provide the capability for a business-critical application to be always available. Always available means just that: Despite virtually any type of syn-

Fault tolerance, integrity inherent in layers of Himalaya

NonStop Himalaya applications and solutions take advantage of data integrity and fault-tolerant capabilities inherent in all the layers underneath. For example, the application is partitioned across several processors, dynamically using additional processors, defined by response time requirements. Applications transparently use additional or fewer system resources, as determined by business requirements, without special knowledge by the programmer.

Integrated manageability tools provide comprehensive systems management capabilities to improve performance, responsiveness and efficiency in a multiprocessor, enterprise computing environment.

ServerNet routing technology provides high-performance interconnection, moving traffic in an any-to-any fashion between system components: processor to processor, processor to disk, disk to disk, and so on. ServerNet technology provides low-CPU overhead, fault tolerance and data integrity

through error checking, scalability up to 1,000,000 network elements, and low cost.

Tightly integrated parallel relational database and transaction management software give applications access to the parallelism of

NonStop Himalaya servers, providing limitless scalability, continuous availability, and absolute data integrity. This software is designed especially for critical data warehouse and OLTP applications.

The distributed NonStop Himalaya operating system is the ideal foundation for business-critical applications. Unique process pair technology means applications always get the data they expect. If an application process, a network process or processor fails, a backup process takes over, transparently to the user.

Fault-tolerant, message-based, shared-nothing architecture connects from two to 4,080 processors. Each has its

own instruction unit, memory, router connection and copy of the operating system.

term failure, your customers will still be able to move around funds, buy and sell shares of stock, or log on the Net to complete a secure, electronic transaction at your web storefront.

Always available also means that spikes in processing volume won't bring a system to its knees. On Oct. 29, 1997, the New York Stock Exchange and the NASDAQ Exchange processed more than 1 billion shares each—for the first time ever. At times during that most frenetic of days, network traffic reached more than 200 messages per second.

According to the *San Francisco Chronicle*, "the system was capable of handling up to 300 [messages per second] without blinking an eye." At the heart of the computer systems at these two exchanges are NonStop Himalaya servers.

Continuous availability formula

NonStop Himalaya solutions achieve this robust level of scalability and availability thanks to hardware, software and system-level services that are tightly integrated from top to bottom. This means that, despite hardware or software failures, operations from the highest level to the lowest continue without missing a single beat.

As a network of Himalaya servers grows to include thousands of processors on a global scale, the operating system presents a single image that enables users, system managers and applications to interact with the entire network as if it were a single system.

Other high-availability systems are comprised of components from a large

High Availability for Huge Data Warehouse

Dayton Hudson Corp. is one of the largest U.S. general merchandise retailers, ranked 27th on the Fortune 500 list. It operates nearly 1,100 stores in the U.S., including Target, Mervyn's and its own quality merchandise department stores.

Dayton Hudson employs a data warehouse solution from Compaq's Tandem Division to manage information about sales, inventory, profitability and in-stock levels for all 807 Target stores, and will also soon incorporate data from

its two other divisions. This data warehouse, one of the world's largest, is based on the highly scalable and reliable Tandem NonStop Himalaya technology from Compaq. This solution won Dayton Hudson the Data Warehousing Institute's 1998 Best Practices Award.

"NonStop Himalaya technology provides us with the most scalable and available solution to manage [the] data explosion across all divisions of our company and to leverage it for continuing competitive success," says Brigel Bonner, vice president of Network and Computer Services at Dayton Hudson.

One major strength of the data warehouse has been its ability to stay online dur-

ing basic database operations. The company recently moved more than 100 Gbytes of a 200-Cbyte table to new disk drives while users maintained full access to data. The system generates more than 100,000 queries a month, often with more than 120 queries running at the same time.

The data warehouse has reduced operational costs, and has also allowed Dayton Hudson to better its inventory management by improving its margins, markdowns and in-stocks. In addition, its micromerchandising strategies are made more effective by fully leveraging data on trends, seasonal products and the effectiveness of advertising.

selection of vendor solutions at each layer. When a business chooses a highly available enterprise solution, the cost of downtime, support and maintenance, and, ultimately, customer satisfaction, form the basis for a decision. The tight integration of NonStop Himalaya solutions makes them far easier to manage and support than a hodgepodge of components from disparate sources.

When disaster strikes

Even the most fault-tolerant, integrated hardware and software solution is useless in a natural disaster. NonStop Himalaya solutions can be integrated with additional software facilities, such as NonStop RDF (Remote Database Facility) software, for a full online disaster recovery solution. With NonStop RDF, you can maintain multiple, current online copies of a database on backup systems you designate. If the primary database becomes inaccessible, you can quickly switch your application to a backup site and resume processing—with minimal disruption of service or loss of data. On-site protection can be

► Just because it's planned doesn't mean it's not downtime. An organization still incurs high costs, in labor and in failure to meet service levels to customers, while a system is offline.

The integrated architecture of Himalaya means that operations from the highest level down to the lowest continue without missing a beat.

achieved with the NonStop Himalaya solution certified to Network Equipment Building Systems (NEBS) requirements for Seismic Zone 4, which can withstand power outages, temperature fluctuations and earthquakes.

Not all downtime is accidental

Planned maintenance and upgrades are a major cause of downtime. Just because it's planned doesn't mean it's not downtime. An organization still incurs high costs, both in labor and in failure to meet service levels to customers, whenever a system is offline.

NonStop Himalaya is particularly efficient in this area, too. On other systems, hardware upgrades, operating system patch installations, application re-partitioning and other operational tasks must be scheduled either after-hours or on weekends. But with continuously available NonStop Himalaya solutions, virtually all operations can be performed while the system remains online.

Go back to Oct. 29th, 1997. In the midst of the heaviest trading day in Wall Street history, not only were processors added to the system, but a disk drive, close to reaching capacity, was upgraded—ALL without causing a ripple.

NonStop Himalaya solutions allow easy database reorganization

and the ability to install software fixes while your business is online. The database can be kept online and available, and can process data at the same time you back up the database or restore a partition.

Features such as the ability to perform online maintenance and reconfiguration, swap a failed board or peripheral, add processors or storage, or hot-swap controllers and processors, are making their way into other hardware platforms as well, but NonStop Himalaya continues to lead in capabilities such as online change and operations management. The system detects the presence or absence of a component and quickly re-integrates a replicated component into the system. This enables business-critical applications to be continuously available.

Cost of ownership

To many organizations, features like these sound prohibitively expensive. But are they? To tally the full cost of ownership of an enterprise computing solution, an organization must evaluate the direct purchase costs, the cost of hardware and software maintenance, and the cost of ongoing support, over the full lifecycle of the solution. They must also factor in the cost of downtime (both planned and

High Availability, Out. Downtime, Non.

Over the past decade, the SBF has become one of Europe's leading trading stock exchange. Thanks to the exchange, which handles the market throughout the day, investors in most European countries can trade shares of more than 1,000 companies. Total market turnover exceeds 4

trading systems. Running on the full range of NonStop Himalaya servers, including the newest 570000 with ServerNet clustering technology, the solution takes advantage of unique parallel hardware and software to ensure that transactions are processed and that information is distributed without fail 24 hours a day.

"The 'money' dimension is very important," says Yves Rouchoy, senior vice president at the SBF-Paris Bourse. "The securities industry has become much more competitive in recent years. If an exchange cannot guarantee performance and high availability, business can quickly

be lost to other marketplaces."

The automated trading system can handle as many as 100 messages per second, processing up to 40 orders per second, with a response time of less than two seconds on most transactions.

The NSC-SuperCAC solution has been adopted by the Chicago Mercantile Exchange, Toronto Stock Exchange, and exchanges in Sao Paulo, Lisbon, Mexico, Morocco, Tunisia and Warsaw. This widespread acceptance has positioned NSC-SuperCAC as the "world's leading automated trading system for exchanges."

NonStop Himalaya servers at the core of your business

A group of visionary engineers laid the foundation over two decades ago. Design a system from the ground up that is architected to provide the essence of success for every business. NonStop systems did just that from the beginning, and will continue to do so into the future. Continuous refinements over the years have built on the original successful fundamentals of NonStop systems.

- Availability second to none
- Virtually limitless scalability
- Data integrity
- Manageability throughout

Your business depends on continuous availability to compete in today's online world.

Today's NonStop Himalaya server is the most powerful, reliable resource for your business.

unplanned) of any solution.

When you consider the full benefit of continuous availability in mission-critical environments, a NonStop Himalaya fault-tolerant server can be more cost-effective than other solutions. Continuous availability and fault tolerance is inherent, out of the box. No add-on hardware or software is required to reach zero downtime.

According to the Standish Group, 72% of mission-critical applications experience at least nine hours of downtime per year. That comes to over \$5 million a year for one application. And that's about what you could expect at 99.9% availability. But with the NonStop Himalaya system, you can realistically expect to push your downtime to zero, keeping hundreds of thousands—or even millions—of dollars in the corporate coffers.

Fitting a specific solution

No single solution fits all environments. With a portfolio that spans

hardware, software and services, Compaq provides integrated, high-availability solutions tailored to meet a customer's requirements for availability and performance—and for their budget as well.

Compaq's thrust into enterprise computing, with the addition of Digital Equipment and Tandem, creates a full spectrum of solutions. For departmental applications, there is a range of industry-standard servers designed to meet your needs. For important applications such as e-mail and departmental databases, Compaq offers more robust solutions, such as clustered ProLiant servers built using industry-standard ServerNet interconnects, and running Microsoft Cluster Server for failover and hot standby.

Finally, for environments where downtime is not an option—a 24x7 customer support center, credit card transaction processing or a web storefront—Compaq offers the NonStop Himalaya. This solution completes the high-end of Compaq's enterprise strategy, built around the industry standards that Compaq is now driving into the enterprise—the message-based infrastructure that has now been implemented in Microsoft Cluster Server, and ServerNet, the de facto standard for high-speed cluster interconnect.

Advancing the evolution of these technologies and the NonStop Himalaya architecture is a cornerstone of Compaq's strategy. With continuously available systems running your business-critical applications in a 24x7 global economy, you too can expect the ultimate in uptime. You can expect your enterprise to maintain its competitive edge well into the next century.

And you can be assured that your company will always be open for business. ■

Data mart users must try, try again

CONTINUED FROM PAGE A7

would install marts for other groups.

That first mart consolidated reference data, which included staff information, building locations and data relating to regulatory requirements such as the handling of hazardous substances in lab areas. But would that be data to be important to anyone else?

POLITICAL QUESTIONS

The various source systems for the data used different coding schemes, and there were political challenges in determining which organizations had responsibility for which data, said Patrick Nolan, MIS engineering manager at Stanford.

Now that the university has additional marts, which cover areas that range from capital asset management to uniform resource locators, it is attempting to retrofit some order by standardizing data-extraction routines using Informatica Corp.'s Powermart tool and by

building formal data models.

Even when organizations have the best intentions to plan their data mart architectures up front, they often find themselves playing catch-up as the competitive environment changes.

For example, NationsBank Corp. in Charlotte, N.C., last year, built the Customer Relationship Information System (CRIS), which tracked business accounts. This year, it plans to leverage its CRIS experience with a mart covering the bank's 13 million consumer households, plus a new Balanced Scorecard system to encourage and more effectively measure goals such as customer relationship building, operational excellence, customer satisfaction, risk management and financial results.

The initial IBM SP4 architecture seemed fine for both marts until the parent company acquired Barnett Bank, Florida's largest retail bank, last year.

That prompted the idea that building a hub-and-spoke environment for data marts would be the most maintainable approach in the long run.

So the architecture shifted to DBA UDB, running on the IBM mainframe. The bank also has added Hyperion Solution Corp.'s *Enterprise and World* for online OLAP World Wide Web presentation tools that are staged by DecisionAnalyst, Inc.'s *Achie*. *Achie* is an OLAP data migration tool that integrates key CRIS business data with data from more than 20 pre-data warehouse sources.

MORE THAN ARCHITECTURE

If shareholders give the go-ahead this week, NationsBank's data mart developers may face yet another challenge: a merger with BankAmerica Corp. in San Francisco, which already operates its own NCR Corp. *Terra* data warehouse.

But architecture may be only half of NationsBank's battle. De-

ciphering user reporting needs for building the query environments and business views within the marts has been a struggle against inexperience.

"It's been difficult to apply lessons learned building CRIS in building newer decision-support systems," said Sue Kilmarin, NationsBank's senior

project manager for the data marts. She noted that users tend to ask for all the data they can get without communicating how they might use it.

"Management decision support is a new area to most of us who came from primarily transaction-processing and operational-decision-support backgrounds. We're learning and adjusting as we go," she said. □

ERP, warehouse unite

CONTINUED FROM PAGE A7

"Because we are a seasonal business, we only get one shot at getting it right," said Justin Whetsting, chief financial officer at Burton.

"It's extremely important for us to know what our business year is going to look like. We get our orders in by March and shipping from April to October," he said.

"Accuracy on the inventory side is critical," Whetsting said. "Because we change our whole

product line every year, any inventory we have left becomes old, and you have an instant markdown if you haven't gotten it to the retailer on time."

MANAGING GROWTH

Burton's major information systems challenges included finding ways to address its explosive growth — sales increased about 20% in the past year — and connect its three offices in Vermont, Japan and Austria. The company had an advantage in that it had grown so quickly it had no old technology to work around.

Using SAP solved half of the problem: Burton was able to capture transactional data from all three offices and collect it in a central location, the data warehouse.

But the company soon found that if it needed to run any non-standard reporting on the SAP system, the 15 staff couldn't handle the effort because it was too small for that level of complexity.

"We discovered that it would be nice to have an OLAP reporting database where the information could be flexible and readily accessible by our management team," said Jennifer Muzac, Burton's MIS director.

"We also needed something that would allow an inventory manager or a product manager the ability to track inventory without running a reporting request through the IS department," she said. "A wide range of people need this information, like our sales, inventory and operations teams and our 15 group."

Most of Burton's executives and about 70% of its middle managers now use the system, Muzac said. □

Don't be doomed by dirty data

CONTINUED FROM PAGE A7

Now, imagine the process of going through millions of records to reconcile the conflicts and make corrections. Some organizations allocate more than a dozen full-time employees to initial data cleansing. Failure to do so results in bad decisions, angry customers and frustrated business users.

A THANKLESS TASK

As you can imagine, it is a thankless job, and most business users lack the appreciation, understanding and patience needed to support information technology profes-

sionals who undertake the laborious process of cleansing that data. Who can blame them? They see it as time-consuming, tedious busywork that offers them no immediate payoff.

Nevertheless, it is imperative that you devote the time, money and resources to cleansing legacy data required for the data warehouse. Otherwise, when that raw data is aggregated, distilled and summarized, the inconsistencies and inaccuracies will distort and corrupt the summary views in ways that will be tough to trace or correct.

If your data warehouse proj-

ect is normal, you'll spend about 75% of the total implementation time on back-end issues such as data extraction and data cleansing. The best strategy is to involve business users and systems analysts — the very people who actually will be using the data — right off the bat.

Data cleansing is a collaborative effort between business users familiar with the semantics (meaning) of the data and the systems analysts who know the program-specific meanings.

GARBAGE IN . . .

Don't even think about loading raw data into your data warehouse. The old adage "garbage in, garbage out" is just as true today as it ever was.

Cleansing applications should investigate, standardize and integrate legacy data. To expedite a departmental data warehouse implementation, consider limiting your data cleansing to the subset of data that's relevant to the departmental data warehouse.

Although IT staff can identify which legacy data doesn't have to be included in a data

warehouse based on current usage of data, they will need help and cooperation from business users to identify and cleanse operational data. Users should be primarily responsible for determining the business value of data. Don't rely on systems integrators — they don't understand the business value of the data.

When user requests drive the data warehouse project, users are more likely to assist with data cleansing. Therefore, structure the data warehouse on usage, not on the relational model.

Automation tools can help, but they can't change the underlying fact of life: Data cleansing is labor-intensive and ongoing. There is no magic "load-and-go" bullet.

A data warehouse grows by leaps and bounds in the first couple of years. The size of the database will compound the data-cleansing requirements.

With those insights in mind, go forth and cleanse! □

Atre is president of Atre Associates, Inc., a consulting firm in Santa Cruz, Calif., that specializes in data warehouse and data integration technology. Her E-mail address is shukla@atre.com and her DataWarehouse methodology can be found at www.atre.com.

Seven steps for cleansing your data

1. Identify data of interest and the business uses of the data.
2. Analyze data for content, meaning and importance.
3. Determine which data to include in the data warehouse.
4. Write procedures for data extraction, conversion and population.
5. Determine the suitability and effectiveness of automated cleansing and extraction tools.
6. Consider an iterative, ongoing data warehouse process.
7. Extract data, populate the data warehouse and work in parallel on your online analytic processing implementation.

Managing

Lotsa talk, little walk

By Gary H. Anthes

There's no shortage of statements supporting information security, but a *Computerworld*/Ernst & Young survey finds little action to back up the words

DESPITE STATEMENTS OF STRONG SUPPORT FOR INFORMATION SECURITY BY TOP MANAGEMENT, AN ASTONISHING NUMBER OF COMPANIES FAIL TO TAKE THE MOST BASIC STEPS TO PROTECT THEMSELVES FROM HACKERS, DISgruntled EMPLOYEES AND INDUSTRIAL SPIES.

And the gap between words and actions seems to be widening as scarce information technology funds get sucked into the black hole of year 2000 repairs.

Those are some of the conclusions from the Ernst & Young/Computerworld Global Information Security Survey of 4,255 IT and information security managers. This is the sixth year Ernst & Young has conducted the survey.

Of those surveyed, 84% said their senior management believes that information security is "important" or "extremely important." But the following results indicate that that concern isn't translating into action:

- Forty-one percent said they don't have formal security policies.
- Three-quarters said they have no incident response plan.
- More than half said they lack disaster recovery plans.
- More than a third said they don't monitor their networks for suspicious activity.
- Fewer than one in five use encryption technology to safeguard sensitive information.

The survey also spotlights a basic misunderstanding of information security dangers.

Asked to identify threats, respondents were almost twice as likely to cite hackers as employees, but studies have shown that the overwhelming majority of security breaches come from inside the company.

Thirty-two percent of the managers surveyed said security is the biggest barrier to electronic commerce. (Inadequate technology was cited by 26%, and unfavorable economics was mentioned by 25%.)

But there were encouraging signs that the security barrier is beginning to yield: The survey showed a sharp reduction in just a year in the number of complaints about the adequacy of security products.

"Over the past two years, security awareness has definitely increased," says John Darbyshire, a partner at Ernst & Young LLP and head of

the firm's security practice. "But many people are still not acting on it, and senior management isn't putting its checkbook where it needs to be just yet."

FRIENDLY ATTACKS

One way to get management to take information security seriously is to perform penetration testing, in which a company uses automated tools to probe its own systems for security holes. That shows management the vulnerabilities that are found and their implications, Darbyshire says. "There's shock value in attack and penetration work," he notes.

John Wylder, a senior vice president at SunTrust Banks, Inc. in Atlanta, agrees that show-

ing management the results of penetration tests can be effective, provided security vulnerabilities are related clearly to business concepts. "You can say that they could have downloaded the customer list for your Jacksonville office—that will get their attention," he says.

But at least one security professional advises security managers to deliver a positive message whenever possible. Management becomes weary and skeptical of gloom-and-doom scenarios, particularly if the company has never suffered a loss, says Paul

Jansen, manager of information security at USA Group, Inc. in Indianapolis.

For example, USA Group used a firewall for Internet access, but Jansen wanted to add another to tighten security on the company's extranet, which was used by customers. Instead of telling management all the terrible things customers might do to the company's systems, he showed that dedicating a gateway to customers could improve security and provide better service. His request was approved.

ANOTHER REASON TO HATE YEAR 2000

"Y2K is the latest reason not to fund information security," Wylder says. He should know; he previously headed information security at SunTrust but now leads the bank's year 2000 project.

Lotsa talk, little walk

By Gary H. Anthes

There's no shortage of statements supporting information security, but a *Computerworld*/Ernst & Young survey finds little action to back up the words

OSPITE STATEMENTS OF STRONG SUPPORT FOR INFORMATION SECURITY BY TOP MANAGEMENT, AN ASTONISHING NUMBER OF COMPANIES FAIL TO TAKE THE MOST BASIC STEPS TO PROTECT THEMSELVES FROM HACKERS, DISCRUNTLED EMPLOYEES AND INDUSTRIAL SPIES.

And the gap between words and actions seems to be widening as scarce information technology funds get sucked into the black hole of year 2000 repairs.

These are some of the conclusions from the Ernst & Young/Computerworld Global Information Security Survey of 4,355 IT and information security managers. This is the sixth year Ernst & Young has conducted the survey.

Of those surveyed, 84% said their senior management believes that information security is "important" or "extremely important." But the following results indicate that that concern isn't translating into action:

- Forty-one percent said they don't have formal security policies.
- Three-quarters said they have no incident response plans.

What protective measures have you taken? *

* Multiple responses allowed

According to Wylder, it's easy for management to shorthedge security in favor of projects such as year 2000 because, despite much media coverage of hackers, most companies just aren't getting hacked. Indeed, only 4% of those surveyed said they'd been broken in to from the Internet.

Instead, companies are suffering losses "the old-fashioned way" — through fraud unrelated to computer attacks, Wylder contends. "Management is disappointed to have invested all this money in information security, and then the accountant runs off with the books," he says.

Darbyshire says he isn't surprised by the high percentage of survey respondents without formal security policies and procedures. "Time and time again we see organizations where they are either not there or they've been developed for the mainframe and have not been modified for the client/server environment," he says.

But policies and procedures are the cornerstone of a security architecture, and they require a relatively modest investment — perhaps \$150,000 for a \$50 million company — to develop, Darbyshire says.

The primary impetus for information security shouldn't come from information systems managers, information security professionals or even top corporate management, says Patricia Gilmore, managing director for information security risk management at Charles Schwab & Co. in San Francisco. Rather, it should come from the business unit managers who own the company's products and services, she says.

ation, says no organization can afford to build risk-free systems. But it can build them with "manageable" risks. IS managers at Schwab are beginning to ask business unit managers to sign off on what are acceptable levels of risk in the applications built for them, she says.

Jansen says too many people think technology — firewalls, intrusion detection tools and the like — will solve their security problems. "But if you put a firewall out there and an employee calls an ex-employee and says, 'Here's my password,' what good does your firewall do?" he says.

Another protective measure too often absent is the computer security incident response plan, says Dan Woolley, a marketing manager in Ernst & Young's security practice. Effective response plans require the use of intrusion detection software, he says.

Intrusion detection systems can monitor networks for suspicious activities, such as repeated failed log-on attempts, and can trip alarms when certain kinds of events occur. The survey seemed to suggest a sharp increase in the use of alarms. Only 19% of companies surveyed didn't know if they had been successfully attacked via the Internet, down from 42% the prior year.

BETTER TOOLS

Survey results show that IT professionals are becoming more satisfied with security products, with just 18% saying tools are "the greatest obstacle to addressing security concerns." Last year, 31% made that assertion.

"In the past, IS owned the data, but we're trying to change that," Gilmore says. "We're trying to get the businesspeople to understand they have that responsibility."

Gilmore, who is also president of the Information Systems Security Association,

Enterprise systems management tools integrated with intrusion detection and firewall products are giving the information security specialist unprecedented capabilities, Woolley says. "You get them all talking together, and if there is an attack, you can turn off a connection or backtrack the attack to get additional information," he says.

"We've seen just over the past year a significant number of new tools on the market filling gaps, particularly in the management and monitoring of the environment," says John Pastore, chief scientist at Capital One Financial Services Corp. in Falls Church, Va. Better integration is still needed among tools and products for centralized management of security services such as password control, he says.

Cryptography is one area not much exploited by users so far, the survey found. Just 17% use data encryption for Internet security, 4% use digital signatures, and 5% use digital certificates. One reason is that the technology isn't easily layered on top of packaged applications for which source code isn't available, Pastore says.

Another reason: Users often take a "hard-shell" approach to security based on the assumption that if things such as firewalls and passwords can keep intruders out of systems, encryption need not further protect the data inside. "That's a predominant attitude, and it's kind of scary because the average firewall doesn't take that long to get through," Pastore says.

Cryptography "is the wave of the future," Darbyshire says. "But it's a new technology, a complex technology, and a lot of training and awareness needs to go on at the corporate level to understand the kind of architecture to put in place with it."

But security-savvy IT professionals caution against seeing cryptography — or indeed, any technology — as a silver bullet. "You need to take a step back and realize that you can put in technology, but if you don't do the basics, like awareness programs, policies and procedures and training, it won't do you any good," Jansen says. □

SIGN UP USERS AND CUSTOMERS FOR THE Y2K BUG-BUSTER CORPS

Now that information technology organizations have fewer than 500 days before Jan. 1, 2000, they should be enlisting the help of end users throughout the organization as well as customers from outside.

Although that may seem obvious, it's counterintuitive in many IT shops: Users and customers are seen as the source of endless complaints and demands. But because most organizations won't have enough time to test the remediated systems thoroughly, the internal end users and external customers should be viewed as an inexpensive army of bug busters.

Cynics might argue that new systems are always introduced that way — in the rush to deliver systems on time, the IT organization skimps on testing, leaving the users to find the final few bugs. But it's rare for the IT organization to go out of its way to solicit user feedback. The only common exceptions are companies such as Netscape or Microsoft that release beta versions of their products with the expectation that the users will help track down the more obscure bugs.

FIND THEM FIRST

The obvious task for a year 2000 bug-buster corps is to look for bugs in the organization's internal systems. Sooner or later — preferably, sooner — organizations will have to release into production the systems they test. We won't really know if the systems will handle post-2000 dates until New Year's Day, but the more those systems spend in a live production environment, the better.

When those systems are running, we are going to have tens of thousands of users keying in transactions,

looking at output reports and responding to instructions and decisions made by those systems. If a system experiences a hard failure, everyone in the IT department will know it. But if a date field in an output report is slightly garbled, it's possible that only an end user will see it. A minor bug might cause the end user to do nothing more than curse, but if we offer a bug-buster coffee mug or a \$50 savings bond for each such bug report, it could create an entirely different attitude.

We also could ask our bug-busters to look for bugs in the interface between the organization's systems and the systems of vendors, partners, suppliers and customers. Again, the hard errors will be spotted by the IT department — but there are likely to be thousands of subtle ones. An end user may be the first one to notice that a transaction received from vendor X or customer Y looks a little weird and needs to be investigated further. That may require a phone call to the vendor or customer, and the end user is in a better position to do that than a programmer on the year 2000 project team.

While we're at it, let's get the bug-busters to help us find work-around solutions for the bugs that can't be fixed or the systems that we don't have time to repair. Once again, IT will handle the hard problems, but there are likely to be thousands of minor problems, glitches and disruptions that users will have to cope

with on their own. The easier we get them started on this process, the better. The IT department can provide support with an internal Web site that collects tips, guidelines, work-arounds, shortcuts and other pragmatic advice.

CALLING ON CUSTOMERS

For that matter, why limit this to the corporate insiders? Why not also use external customers? Most organizations are mailing fliers to their customers, advising them (as my bank advised me last month) to "act now and make sure that any items in your home or office that are computer-driven are year 2000-compliant." But next year, we should mail fliers that say, "We're pretty sure that we are year 2000-compliant, but we'd appreciate your assistance in helping us stamp out any little bugs that we may have overlooked. If you spot anything that looks amiss, please give us a call or send us E-mail."

As every IT manager well understands by now, year 2000 is an enormous job. If we treat our end users and external customers as part of the team, we have a better chance of getting through the final 457 days without missing some subtle, but ultimately nasty, show-stopper bugs. □

Yourdon heads the year 2000 service at Cutter Consortium in Arlington, Mass. His most recent book is *Time Bomb 2000*. He can be reached via E-mail at ed@yourdon.com.

I'll get to that — someday

do your IT professionals believe they can't exercise their creativity or be strategic partners with business managers? You might want to look at how they're spending their time.

A recent study finds that the average information technology staff member spends more than three days per week — almost 70% of his time — on day-to-day operations. And only 8% of IT staff members focus on decision-support or think about the future leveraging of technology for strategic advantage.

That finding by The Hackett Group in Hudson, Ohio, was part of a survey on the efficiency and effectiveness of IT

operations. The study covered 80 companies with annual revenue between \$30 million and \$44 billion.

Christine Gattenio, a vice president at The Hackett Group, cites technology's rapid change as a factor in how IT staffers spend their time. The changes, she notes, can make a company's IT infrastructure so complex that it can be difficult to manage. Ironically, the changes can diminish the IT staff's potential as a strategic partner. Technological changes are harder to manage, and companies say they "need help in figuring out how to leverage" new technologies, she said.

The study also found that the average

company spends \$9,218 per year on IT per end user, excluding one-time investments in software and infrastructure. The top 25% of companies in the Hackett database spends less than \$3,387; the bottom quarter spends more than \$11,160. Factors in the disparity include:

- Uniformity in operating systems and programming languages and utilization of data standards. Companies in the top 25% have pushed the implementation of standards across nearly three-quarters of their IT operations. But in the bottom quarter of companies, it's only 40%.

- The number of outsourcing agreements. Top-quarter firms standardize on far fewer suppliers than bottom-quarter companies in all areas of IT outsourcing.

Internet Addiction:

Is it just this month's hand-wringer for worry-warts, or a genuine problem?

By R.W. Greene

Q: How do you know when you're addicted to the Internet?

A: You start blurring your head side-ways to smile. You dream in HTML. Your wife says communication is important in a marriage, so you buy another computer and a second phone line so the two of you can chat....

For many people, the very notion of "Internet addiction" is enough to produce guffaws. The above list of "symptoms" can be found in various permutations all over the World Wide Web. One site consists of an elaborate, 12-step parody of Internet addiction recovery — complete with its own Serenity Prayer.

But for growing numbers of people, such jokes are falling flat.

"My marriage is breaking up because of my husband's addiction, which seems to have destroyed not only our marriage but my husband's personality, his values, his morals, his behavior and his parenting," says one subscriber to an Internet addiction support mailing list. The subscriber said she is a professional in her 40s and asked to be identified only as Rachel. "I had no idea what the potential for destruction was," Rachel writes.

Mental health professionals say they read and hear such sentiments in their E-mail and offices with increasing frequency.

The bright graphics of the Internet — as well as its anonymity and speed — are too much of a good thing for some users, who will neglect family, work and school to stay online.

Maressa Orzack, a therapist in Newton, Mass., tells of one man who threw his wife's modem out the window in disgust at her refusal to log off — only to have her beat him in retaliation. In another case, a boy whose phone line had been cut by worried parents climbed out a third-floor window to reach it.

According to New York-based research firm Jupiter Communications, Inc., there will be more than 116 million Americans online by 2002. Some researchers say 5% to 10% of Internet users have the potential for an addiction problem.

Though the number of people being treated is very small — perhaps no more than a few hundred nationwide — many mental health professionals say the problem is no fad and bears close watching as the world gets increasingly wired.

Almost nobody blames the Internet itself for people's overreliance on it. And therapists recognize that an Internet addiction (though not everybody uses that word) carries none of the destructive power of addictions to drugs or alcohol. But

something is going on, most agree.

"There are three components that need to be present for any addiction: increased tolerance, loss of control and withdrawal," says Steven Ranney, coordinator of research and training at the Illinois Institute for Addiction Recovery at Proctor Hospital in Peoria. He believes Internet addiction qualifies.

SOME DOUBTS

But eyes still roll in some therapeutic quarters. Columbus, Ohio, psychologist John Grohol contends the incidence of extreme Internet use, while it may exist, is largely the creation of a mainstream media always eager to focus on "the dark side of the Internet."

"I just don't understand why there's this focus on the Internet," Grohol says. "People have been dropping out and getting divorced for years and years and years, for a myriad of reasons."

Bryan Pfaffenberger, an engineering professor at the University of Virginia in Charlottesville and the author of several books on the Internet, used to be a skeptic himself.

"People who use the Internet and don't feel they have a problem with it probably react as if this is another one of these sorts of whiny victimization things," he says. "I used to think that... until a student of mine did a report on a bunch of recent research that's been done that indicates there's a real serious problem here."

SIGNS OF IMPAIRMENT

That research, though early and limited, tends to support Pfaffenberger's view. One of the more widely publicized reports was published in 1996 by Kimberly Young, a psychologist at the University of Pittsburgh, who studied 396 self-described "dependent" users of the Internet and 100 nondependent users.

In Young's study, dependent users

spent an average of 38.5 hours per week online, whereas nondependent users reported fewer than five.

Though conceding that the study had "significant limitations," Young also found that 90% or more of the dependent users said they suffered "moderate" or "severe" impairment in their academic, interpersonal or financial lives. Another 85% said they had suffered impairment at work. By contrast, none of the nondependent users reported any impairment other than lost time.

Young, who recently published a book, *Caught in the Net: How to Recognize the Signs of Internet Addiction and a Winning Strategy for Recovery*, has established an Internet addiction consulting site. She also counsels people online — a practice

that is effective, Young says, despite its obvious irony.

That treatment varies. Some users are simply counseled about ways of improving their time management and self-discipline. Some therapists, such as Orzack, view obsessive online use as a symptom of deeper problems and try to treat them. As Ranney's hospital in Illinois, abstinence from the Internet is preached.

Similar problems were found in a 1997 survey of 531 students at the University of Texas at Austin conducted by psychologist Kathy Scherer. There, 98% of dependent users said they found themselves staying online longer than they wanted. More than a third reported problems in social, academic and work responsibilities that they attributed to overuse of the Internet. Almost half said they had tried to cut down but couldn't.

"It's really clear that it's a problem for some people," Scherer says, particularly in higher education, where Internet connections are becoming mandatory. Scherer conducted self-help counseling workshops for students concerned about their Internet use at the University of Texas. It's worth noting, however, that no such

workshops were held this past academic year because not enough students signed up.

The workplace isn't immune from such problems. Increasing numbers of supervisors discipline and even fire employees who spend too much time cruising pornographic and other non-work-related sites — that is, if the employers recognize the problem at all. In her study, Young tells of a 48-year-old secretary who went to her Employee Assistance Program for help with her inability to stay away from non-job-related Internet sites. The office rejected the secretary's request on the grounds she didn't suffer from a legitimate disorder. She was later fired when system operators noted her heavy Internet use.

A 24-year-old mailing-list subscriber who wished to remain anonymous says his online obsession (MUD) games had a definite impact on his college career.

"At my peak in 1993, I was playing sometimes 11 hours a day, sometimes 11 hours straight," he writes. "I did poorly in [more demanding classes] because I would work for 20 minutes and then go MUD for two hours, come back, work for another 20 minutes, then MUD for four hours, then go to sleep."

PUSHING BUTTONS

A recent study of 165 nonobsessive Internet users, done by Carnegie Mellon University in Pittsburgh over two years, stated: "Greater use of the Internet was associated with declines in participants' communication with family members in the household, declines in the size of their social circles and increases in their depression and loneliness."

That study made a big media splash — it ran on the front page of *The New York Times* — partly because its authors and sponsors, many of the latter IT vendors, expected the opposite result: a brave new world of expanded social interaction. The reality is more complex.

"People online stay safe because they can push a button and get rid of any unwanted visitor," Rachel writes. She has since separated from her husband. She writes of her spouse: "He would say really nasty things to me, then run up and get on the computer and he outraged that I wanted to discuss what he just said to me. I think if he had a magic wand, he would have zapped me into another dimension." □

ATTEND

Washington
DC
CORPORATE
TECHNICAL
RECRUITING
CONFERENCE
COMPUTERWORLD

The Computerworld Washington, DC Area Corporate Technical Recruiting Conference!

Monday, September 28, 1998
Fairview Park Marriott, Falls Church, Virginia

On September 28, 1998, you have a special opportunity to update your recruiting skills and network with recruiters in your area at the third annual Washington, DC Area Corporate Technical Recruiting Conference, held at the Fairview Park Marriott, Falls Church, Virginia.

A Full Schedule of Contemporary Topics

7:45am Continental Breakfast & Conference Registration

8:30am Concurrent Sessions:

Building an Internet Recruitment Strategy
Tracey Claybrooks, Claybrooks & Associates
Retaining the Best: Practical Retention Strategies that Work
Barbara Mitchell, The Mitchell Group
High Tech/High Touch: Creating the Recruiting Office of the Future
Sue Kaefer, The Kaefer Group

10:00am Sponsor Showcases/Coffee Break

10:30am General Session:

Strategic Staffing in a Competitive Environment
Carlos Echalar, Litton PRC

12:00pm Luncheon Keynote:
Paul Gilkin, Editor, Computerworld

1:30pm Town Hall Forum
Moderator Gary Cluff, Cluff & Associates

3:00pm Sponsor Showcases/Coffee Break

3:30pm Concurrent Sessions repeat:

Building an Internet Recruitment Strategy
Tracey Claybrooks, Claybrooks & Associates
Retaining the Best: Practical Retention Strategies that Work
Barbara Mitchell, The Mitchell Group
High Tech/High Touch: Creating the Recruiting Office of the Future
Sue Kaefer, The Kaefer Group

5:00pm Program ends

Selected Sessions Include:

Luncheon/Keynote Address

Paul Gilkin, Editor, Computerworld

Paul Gilkin, one of the industry's leading watchers of the Information Systems profession, will give you an up-to-the-minute view in this very special keynote address.

Building an Internet Recruitment Strategy

Tracey Claybrooks, President, Claybrooks & Associates, Inc.

As mass advertising reaches a consumer by television, radio, billboard, print media is vast new business and success - this same marketing/promoting effort can take place on the Internet to maximize your recruitment efforts. Learn about this and more in this session.

Strategic Staffing in a Competitive Environment

Carlos Echalar, Vice President of Staffing, Litton PRC

The program will address today's staffing issues from a proactive vs. reactive business approach. The program will also demonstrate a systematic 5 step approach to a full life-cycle staffing process and implementation across the business. Each step contains concepts and issues that need to be considered in developing and implementing a strategic plan of identifying and attracting today's top talent in an effective and cost efficient manner.

Town Hall Forum

Gary Cluff, President, Cluff & Associates

In this session, you'll not only be able to propose your specific questions for open discussion, you'll learn of real world issues and solutions from your peers. You won't want to miss this rare opportunity as Gary Cluff, an expert in the HR field, leads us through this modern discussion of your recruiting topics.

Registration fee includes continental breakfast, lunch and the complete Conference Resource Guide.

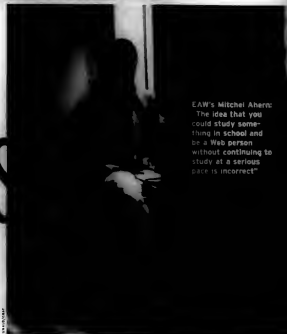

This conference program is developed exclusively for corporate human resource professionals who recruit directly for their hiring organizations. Vendors of selected, targeted products and services may participate through sponsorships and/or exhibits.

**For more information, call the conference hotline:
1-800-488-9204**

IT Careers

THE NEW WEB WALKERS

By Natalie Engler

EAW's Mitchell Ahern:
The idea that you could study something in school and be a Web person without continuing to study at a serious pace is incorrect.

Blurry job titles. Bifurcation. Business technologists. Big bucks. That about sums up the state of Internet careers for this year.

"Because it is such a fast-moving field, the titles don't have that much meaning," says Mitchell Ahern, webmaster at Eastern Acoustic Works (EAW) and chairman of the Association of Internet Professionals.

The solution: "People are hiring by skill sets," Ahern says.

At the same time, the gap between the utility infrastructure and business support is widening, says Steve Tellegen, an analyst at Giga Information Group. "Over the next five to 10 years, people who deal with network administration, systems administration and basic infrastructure pieces may wind up working for an [Internet service provider] instead of a Fortune 500 corporation."

There isn't enough
people who really
understand the sub-
tleties of the busi-
ness they are in
- David Foote
Cromwell Foote

Those who remain in corporations will need to become business-savvy communicators, analysts say. "One thing we're seeing in the association and in the industry is that people who can straddle the fence [between business and technology] are important commodities," Ahern says.

"It used to be that just being technical was enough," agrees Mark Liphardt, a senior technical executive in the Network Commerce Services division at ATEC Corp. "Now, you have to understand how the business operates, so you know how to integrate and automate what it does."

Today, people who possess both sets of skills are in short supply and often can command six-figure salaries. That's because they are the

key to successful electronic-commerce initiatives, asserts David Foote, managing partner of Cromwell Foote Partners LLC.

"There aren't enough people who really understand the subtleties of the business they are in and their customers," Foote says. "You can pick up technical skills until you're blue in the face, but you have to learn your customers as if you're one of them. You have to sit in their skin and look at the world through their eyes and ask 'What do they want us to deliver? What are they looking for?'"

"Whether it's cascading tile sheets or doing things with active server pages, there's a lot of interest in that capability," Liphardt says. "People who use the new methods are in demand because as the Web changes, what was new online yesterday is old today."

The most valuable Internet/intranet professionals will be those who combine a solid business understanding with technical skills. Webmasters, such as Ahern, who are in charge of content will remain in high demand among end-user companies. So will business technologists, such as Liphardt, and electronic-commerce experts, such as Bob Lavorgna. Here are their stories:

MITCHEL AHERN

Chairman, Association of Internet Professionals
Webmaster, Eastern Acoustic Works,
Whitinsville, Mass.
mahern@association.org
Age: 39

PRIMARY RESPONSIBILITIES: Ahern maintains all Internet services, develops the World Wide Web site and works on CD-ROM and multimedia projects for EAW, a privately held company that manufactures speakers used in rock 'n' roll touring environments, stadiums, arenas and other venues.

AREAS OF EXPERTISE: Interactive/multimedia; Macintosh webmastering; community building.

PRIOR EXPERIENCE: Ahern ran a small advertising agency, of which EAW was a major client. He has a degree in philosophy and was a disc jockey and a board member for community radio and television stations. "I consider myself neither high-tech nor low-tech," he says. "I'm a medium-tech person. I feel like the technology has come down to me."

UPSIDE: Staying up to speed with the new technologies. Creatively solving problems. Controlling his own learning curve and career path.

DOWNSIDE: Not having the budget to develop more extranet-type functions.

BIGGEST CHALLENGE: Keeping everything in balance. Learning new technologies. Motivating staff. Keeping interns and assistants.

WEB SKILLS USED REGULARLY: Database integration. Server and site management software. Graphics programs. Digital video camera and editing systems.

HOW SKILLS WERE ACQUIRED: Mostly self-taught — on the job and on weekends. "Everything I knew from two or three years ago when

I started with this is obsolete or has been built on," he says. "The idea that you could study something in school and be a Web person without continuing to study at a serious pace is incorrect."

ADVANCEMENT POTENTIAL: "These guys would like me to stay here forever, and maybe I will," he says. "On the other hand, I get hit with offers on a somewhat regular basis."

ADVICE: "The Internet is still a very young industry," Ahern says. "Take a couple of quick courses and find yourself an opportunity where you can work in the field. It doesn't take long to build yourself into a functional level."

MARK LIPHARDT

Senior technical executive
Network Commerce Services division, AT&T,
Los Angeles
mliphardt@association.org
Age: 44

PRIMARY RESPONSIBILITIES: Liphardt manages the developer channel for the Western U.S., a program that tracks Web developers to help build Web sites with AT&T's customers. "My role has often been the liaison between the technical and business side, helping them decide what to do and what is possible in any given period," he says.

AREAS OF EXPERTISE: Data and voice communications; Internet Protocol technologies and future electronic, implementing electronic commerce systems; developing online commu-

THE HOTTEST WEB JOBS

According to a survey by Cromwell Foote Partners LLC, the highest-paid Internet/intranet positions are:

CORPORATE/GOVERNMENT SECTOR

JOB TITLE	SALARY*
Director of Web systems	\$111,446
Internet/intranet project manager	\$96,969
Content/marketing webmaster	\$92,644
Web architect	\$89,922
Technical webmaster	\$87,031
Web security manager**	\$80,789
Web engineer	\$73,953
Web developer/programmer	\$67,577
Web systems administrator	\$63,615

*National average **Gaining in pay and prestige

THE HIGH-TECH INDUSTRY

According to a survey by the American Electronics Association, these five Web positions rank highest in average salary:

Internet strategist	\$121,200
Electronic-commerce manager	\$120,100
Internet strategy director	\$114,700
Server engineer	\$88,700
Web technologist	\$78,800

nities; security systems; understanding how businesses operate.

PROF. EXPERIENCE: Independent consultant for 10 years doing systems design, strategic planning and software development.

UPSIDE: "I have a lot of influence on how we're doing things in our organization," he says.

DOWNSIDE: "I can't always make things happen at the speed of thought." But seriously, "there are pluses and minuses to working for a very large organization. That might be one of the things that makes it a challenge. But I like challenge. That's what drives me."

BIGGEST CHALLENGE: Keeping "everyone's interest in balance with what is possible at any given time and coming up with solutions," Liphardt says.

WEB SKILLS USED

Web hosting, streaming technologies and database integration.

HOW SKILLS

WERE ACQUIRED: Many years of study, self-teaching, industry training, Networking training, Novell Certified NetWare Engineer, Cisco classes for routing, AT&T classes in communications protocols. Trade shows, seminars and events such as Comdex, Internet World (where Liphardt speaks) and other local networking shows.

ADVANCEMENT POTENTIAL: "I can continue to grow within AT&T in the IP technology space," he says. At the same time, "I always keep my eyes open to what's going on out there." Liphardt says he may consider an "executive position at a start-up company with some novel technology and a good idea."

ADVICE: Network with peers. Go to trade shows. Keep up with the latest advances in Hypertext Markup Language, Java and database integration. Good project management skills are also very much in demand. "It helps to be able to see the big picture from a systems analysis standpoint and communicate that to the designers and to management, so the final result is what everyone wanted to happen," he says.

BOB LAVORGNA

Director of electronic commerce
The Hartford Technology Service Co., a business division of The Hartford Financial Services Group, Inc., Hartford, Conn.
Age: 40

PRIMARY RESPONSIBILITIES: Lavorgna works for an internal/external consulting firm within The Hartford, one of the first insurance companies on the Web. He oversees the electronic-commerce suite, which includes Internet and intranet development and production support, E-mail, collaborative applications, as well as electronic file transfers, electronic fund transfers and electronic data interchange.

Lavorgna also makes sure The Service Co.'s solutions are competitive with those offered by external consulting companies. He spends time marketing, costing and pricing. A typical

RESOURCES

Association of Internet Professionals
Largest internet professional trade association

Society for Information Management
Regional Learning Forums
www.simmt.org/ffweb/index.htm

work involves "a fair amount of interaction with the customer base, talking about what the technologies can do for their business," he says.

PROF. EXPERIENCE: Lavorgna has been on the technical side of The Hartford's IT organization for more than 17 years. He started out as a programmer, working on midtier and PC applications. He then managed support for those environments and moved into telecommunications and was responsible for network design and installation. Next, he set standards for the company. All of those experiences, he says, prepared him to take on electronic commerce.

UPSIDE: "The technology is very exciting [as is] the ability to satisfy customers quickly and see the bottom-line results." So is the "entrepreneurial spirit" of the internal consulting model.

DOWNSIDE: Staying on top of technology because it's such a fast-changing environment.

A SATISFYING PROJECT: An electronic-commerce application that lets insurance agents and employees in the field download forms needed to complete a sale around the clock. The project integrates Lotus Notes, the Web, faxing and E-mail and was written in less than a month. "We've been able to secure sales during off-hours because the forms were available immediately online, instead of having them be mailed from one location to another," he says. The project reduced the printing and processing costs.

WEB SKILLS USED MOST OFTEN:

"Looking at the business problem and the ways we can solve it through applications we have built or can build."

ADVANCEMENT POTENTIAL: Lavorgna could go into technical management or the business environment. "There are a lot of different avenues one could take," he says. "More and more companies have electronic commerce in the business as opposed to as an IT function."

ADVANCEMENT STRATEGY: "I don't plan my career in certain steps. I make sure I'm ready for opportunities as they arise."

ADVICE: To head up electronic commerce, "you have to truly understand the business," he says. Lavorgna also recommends the Society for Information Management's Regional Learning Forums. "It gives you a tremendous ability to understand your strengths and weaknesses, [as well as] a holistic look at your career. The topics vary from how do people learn — and how do you learn — to mentoring and coaching and listening." □

REGIONAL SCOPE

Southern New Jersey & Philadelphia

IT employers that want to lure H-I-B talent can take lessons from the country's largest H-I-B hiring market

FOREIGN AFFAIRS

By Jill Vitiello

As the information systems shops of corporate America scramble to meet the unimproving year 2000 deadline, more firms than ever are angling to hire foreign IT professionals. Cobol programmers, the mainstay of year 2000 conversions, are plentiful in Russia, Israel and India, where mainframe technology still rules.

"They are willing to work on those systems here in the U.S., and it's a great way for them to break in to this market," says David Sears, president of D. L. Sears & Associates, Inc., an information technology consulting firm in Morris Plains, N.J. All they need are H-I-B visas, which are in short supply.

The H-I-B visa lets foreign professionals work in the U.S. for a certain length of time; the U.S. grants only 65,000 H-I-B visas per fiscal year. In fiscal 1998, the cap was reached by May, mostly by firms filling IT positions. Despite some wrangling in the House and

SAP developers	Hungry for more	Almost enough
Web developers	Hot	Hot
NI networking experts	Hot	Certified MCSEs, please!
Certified Novell engineers	Glad to see you!	Cooling off

Source: IT SourceLink, Princeton-based Coopers

Senate this summer, Congress has not raised the cap, and isn't expected to revisit the matter any time soon, according to Irving Spitzberg, president of The Knowledge Co. in Fairfax, Va., an organization that evaluates the educational and professional experience of foreign nationals for prospective employers

and for the federal government.

So who's been hogging all the H-I-B visas? Pennsylvania and New Jersey, according to The Immigration and Naturalization Service. A report issued by the agency earlier this year showed that the firms that sponsored the most foreign high-tech workers from October 1997 to March 1998 were located in Pennsylvania, which ranked No. 1 with 1,217 visas, and New Jersey, which ranked No. 2 with 1,080 visas.

For each foreign IS professional they sponsor, employers can expect to pay \$2,500 or more in legal and other fees, according to Amy Naples, director of human resources at Blarstone Software, Inc. in Mount Laurel, N.J.

In Philadelphia, PricewaterhouseCoopers has more than 20 IS professionals overseas waiting for the H-I-B visa cap to be lifted on Oct. 1. They'll join the company's SAP consulting practice in cities nationwide, according to Lori Desiderio, recruiting manager for the Big Five firm. □

Vitiello is a freelance writer in East Brunswick, N.J.

Casino technology

IT in the cards?

Although several Fortune 500 companies are settled in lush campuses in northern New Jersey, southern New Jersey is known more for its resort communities. None is more prosperous than Atlantic City, where legalized gambling takes place at the 12 casinos that line the famous boardwalk. In the tight-knit information technology community there, chief information officers and information systems directors meet monthly for breakfast, with the various properties taking turns hosting the event.

"We share solutions and ideas at a high level in a spirit of cooperation," says Art Lucchesi, vice president of IT at the Claridge Casino Hotel. "In the details, however, we're still competitors."

Licenses required: All casino employees, including IT professionals, are subject to strict regulations that ensure the fairness of play at the gambling emporiums. For example, programmers may need gaming licenses because the work they perform involves confidential information. For the most part, IT opportunities are limited to those who have experience with casino and/or hotel applications.

Computer convention: Training for a variety of casino jobs is available at Atlantic Community College, according to Kathy Corbello, executive director of college relations. The college offers many courses online to accommodate the erratic schedules of casino employees, whose shifts frequently change over the course of a traditional semester.

— Jill Vitiello

Tips for tapping the foreign IT talent pool

1. Find a law firm with experience in completing H-I-B visa paperwork. Negotiate for a volume discount.
2. Send in-house recruiters abroad. Station them around the globe or dispatch delegates periodically.
3. Establish a business relationship with international IT recruiting firms.
4. Create a process for helping foreign workers find housing, get a car or learn the transportation system.
5. If possible, match U.S. newcomers with members from their own countries to help them become accustomed to American life.
6. Review workplace policies to help foreign nationals understand expectations for conduct in corporate settings.
7. Be aware of cultural differences and ask questions when a communications gap arises. For example, one recruiter thought a candidate from India was disagreeing with everything she said because he shook his head. In India, however, that gesture indicates agreement.
8. Invite foreign workers to share information about their cultures. Do it informally, over a lunch-long lunch or at a local restaurant, but be sensitive to dietary restrictions when choosing the eatery.

Optimum Consulting

Optimum Consulting is a
 National Implementation Partner to SAP America

Catholic Health Initiatives (CHI) is one of the largest Catholic, non-profit health organizations in the
 country. With 120+ hospitals and 70+ long-term care facilities, CHI is proud to continue the Catholic
 healthcare tradition well into the future. Each of the hospitals within our system plays a unique role in
 helping us to realize our vision - to provide unparalleled health care to the communities we serve.

CHI has begun to execute its enterprise IT strategy and now has the following open positions in our
 Eastern Region IT Division:

• Desktop/Network Services:

Executive to direct region-wide technology func-
 tions, including desktop, server, voice, data, im-
 age, processing systems and data center opera-
 tions. Leads team of 35; requires at least 7 years in
 IT management in fast-growing, multi-location or-
 ganization; must be technology strategist with op-
 erations experience.

• Director, Applications Development:

Healthcare technology executive with 7+ years
 in IT management to direct region-wide applica-
 tion systems including clinical, financial, adminis-
 trative, managed care and decision support; leads
 team of 25; must be strategist with strong project
 management skills; experience in man-
 aged care preferred.

• Decision Support Clinical Analyst:

Assists in the design, implementation, and main-
 tenance of the TSI Transition for Quality System.
 Works closely with Hospital clinical and man-
 agement staff in utilizing decision support systems
 to develop and manage clinical pathways and
 integrate patient review activities. TSI TQ expe-
 rience desired.

• Decision Support Clinical Analyst:

Participates in the implementation of decision sup-
 port systems that will support the clinical needs
 of MBO's and regional entities, assist in the de-
 velopment of clinical modules and work plans; co-
 ordinates project tasks with minimal direction. TSI
 T2 experience desired.

• Technology Analyst:

Candidate with breadth and depth — desktop,
 server, code and edge — to work with new tech-
 nologies design and implementation team. This
 group focuses on innovative solutions in a dy-
 namic, distributed health care setting. Challenge
 yourself and your peers.

• Systems Analyst:

A programmer with 2 or more years experience
 with Visual Basic, and/or Visual C++ to develop
 and support system integration projects using
 integration engine and desktop scripting tools.
 Experience with hospital information systems,
 system and database administration, and client
 server programming a plus.

This division currently serves facilities in New Jersey, eastern Pennsylvania, Delaware, and
 Maryland from its regional office in Exton, PA, a suburb of Philadelphia. Please send resume to:
 Philip Annone, Catholic Health Initiatives, 468 Thomas Jones Way, Suite 100, Exton, PA 19341. Fax:
 (610) 363-2913. Email: philip.annone@chi-east.com, EOE.

5 reasons to talk with **CIGNA** this week

1. Opportunity

The CIGNA companies are leading providers of insurance and financial services to businesses and individuals around the world. CIGNA is recognized across the U.S. for our technical initiatives and innovations. We are seeking information systems professionals with client server and/or mainframe experience to support our global businesses. We have immediate openings in applications development, database administration, systems architecture, telecommunications and desktop support.

2. Locations

CIGNA has major technology operations in Center City, Philadelphia, Hartford, CT, Woodbury, NJ and Hanbury, DE. We can match you up to the opportunity that meets your skills and ambition and your preferred lifestyle.

3. Work Environment

As a place to work, CIGNA gets high accolades from today's business media. Selected by InformationWeek as one of 1997's Top 500 information management organizations in the U.S., named in ComputerWorld's 1997 100 Best Places To Work for systems professionals, listed in Business Week's 1997 Top 100 companies for work and family, and made Working Mothers 1997 100 Best companies for working mothers. We're committed to your professional growth and we respect your need to have a fully balanced life.

4. Technology

Development Platform and Tools:

Visual Basic, PowerBuilder, C++, Microsoft, COBOL, CICS,
Java, Informatica, Visual Interdev

Operating Platforms:

Windows 95, Windows NT, OS/2, AIX, MVS

Database Management Systems:

DB2, DB2-2, DB2-4, SQL Server, MS Access

Office Tools and Enablers:

Microsoft Office Suite, Lotus Notes, MS Mail, Lotus 1-2-3, WordPerfect, JetForm

And More:

Imaging, EDI, Decision Support, SQA Team Test, Project Management, Team Leadership

5. Convenience

Check us out at www.cigna.com, then send a resume
in confidence to: CIGNA Staffing Services TR-06,
Dept. 98-CW-021, P.O. Box 41795, Philadelphia,
PA 19101, or e-mail us at jobinfo@cigna.com

Nashua TRACON A DPECC Company

The Van Andel Institute of Education and Medical Research (VAM), an independent research organization focused on expanding the frontiers of medical science and education, is preparing for the new millennium. Our breakthrough scientific research activities have created an exciting opportunity for a research-oriented Information Systems professional to join our expanding organization in a high-level Director position at our Grand Rapids, Michigan facility.

You will provide leadership for strategic planning, management and integration/implementation of information and telecommunication systems. Other duties also include establishing and managing a five-year IT plan.

This position requires a degree in MBS, Computer Science, Business or a related field, along with in-depth experience in management of an IT resource at a large industrial organization, research institute or medical facility. Knowledge of all aspects of scientific and administrative technologies in systems, hardware and software is essential. Must have strong leadership, communication, organizational, and interpersonal skills.

For more information about joining the organization that will impact the future of medical science, send your resume to: The Via Andel Institute, Attn: Dennis Worley-CW, P.O. Box 83, Ada, MI 48301; Fax: (810) 982-9673; E-mail: DonWorley@viaandelinstitute.com EOE

INDUSTRY ALMANAC

Microsoft rules, for now

Monday, Microsoft Corp. (Nasdaq:MSFT) became the most valuable company in the U.S., surpassing longtime titanic General Electric Co. (NYSE:GE), a company known for goods from lightbulbs to jet engines.

Some say the nation's financial outlook is going to be affected because a software company, not a general consumer company, is the most valued. "Software is driving the economy," says Capers Jones, chairman of Burlington, Mass.-based Software Productivity Research, Inc.

But others disagree. "The fact that [Microsoft's] valuation is driving the stock market doesn't mean it's driving the economy," says David Wynn, chief economist at Standard & Poor's DRI in Lexington, Mass. "How many jobs does it create when someone buys a copy of Windows 95?"

Microsoft spent the summer chasing GE for the No. 1 spot. In July, each company's stock value exceeded \$500 billion, putting both well ahead of the pack. But the software vendor eventually came out on top.

To compute a company's valuation, take the number of outstanding shares and multiply it by the company's stock price. As of Tuesday, the calculation looked like this: General Electric had 3,545 billion shares outstanding, closing at 78 1/4% in July, thus bringing the company's total to \$544 billion. Microsoft closed at 70 1/4% and had 2,464 billion shares outstanding, which raised its value to \$546 billion.

Microsoft may be in the cabined seat, but Wall Street analysts don't believe the Redmond, Wash.-based software company will stay there for long. According to Jones, a company usually keeps the No. 1 slot for a few years. By being on top since September 1995, GE held that spot a bit longer than most.

—Debbie McCann

SAP pricing picture still unclear

CONTINUED FROM PAGE 1

pricing for a new series of applications that extend the firm's product reach beyond the back-office realm of R/3. But details about the new scheme and how it will affect users were absent.

SAP also promised to jazz up its user interfaces and make R/3 less complicated to master — and even “fun,” in Platten's words. However, he didn't

specify when R/3 users will actually see an improved user interface, telling attendees it could be “a year or two years from now” before SAP is where it wants to be.

The lack of firm details about the pricing changes in particular made it hard for users and analysts at Sapphire to judge what SAP has in mind.

But some users applauded the basic idea, which boils down to selling bundles of applications that map to how different workers do their jobs.

That could “make pricing more realistic to the way the software is used,” said Robert Betts, director of global information systems at Riverwood International Corp., an Atlanta-based paperboard maker that is installing R/3 plus SAP's new planning and data warehousing applications (see related story, page 20).

The new approach “sounds much more practical than having to buy each piece individually,” said Karen Peterson, manager of business process planning at Lucern Technologies, Inc., a power supply division in

Mesquite, Tex., which is also getting ready to roll out R/3.

Paying SAP's current prices for each application “could become prohibitive when you get to the occasional users” in departments such as sales, marketing and logistics planning, Peterson added.

TOO PRICY
R/3 pricing is based on the number of users registered for each piece of the software, and Platten said that isn't likely to change. But the R/3 approach — which also classifies users into four different categories — would price SAP's new beyond-the-back-office applications out of the market in departments such as marketing, sales and supply-chain planning, he added.

Instead, the company plans to put together bundles of application modules based on “business scenarios” that describe the software tools that different workers need to do their jobs. Per-user prices will then be set for the whole bundle, Platten said.

But Kevin McKay, CEO of

extracts for their customer service departments, which let employees and customers query smaller, faster databases.

For example, a company can construct a Web-based catalog that is actually an extract of its entire inventory, explained Mike Bauer, a partner at Computer Science Corp., a consulting firm in Plano, Texas. Those data extracts would yield quick answers and could be updated weekly or even daily, Bauer said.

ERP systems may also have as much impact on the job descriptions of customer service staff. That was the case at General Mills, Inc. in Minneapolis, which has been running R/3 for about four years. Installing the system has resulted in multi-functional customer service representatives. Those workers now get involved in everything from order-taking to accounting because they can access so much customer data, according to Cindy Hulett, a customer service manager.

Users said they also are grappling with how to integrate ERP systems with legacy customer service systems and are facing frustrating delays until their companies fix those connections between old and new. □

R/3 complexity stymies users

The complexity of using R/3 has long been a cause of grumbling among SAP customers.

For example, a group of 15 business users involved in selecting packaged applications for SunAmerica Life Insurance Co. voted in favor of buying Prophetix, Inc.'s financial software because it looked far simpler than R/3.

“Prophetix is very appealing when you look at the screens, while R/3 looked right the way it's delivered out of the box,” said Roy Matshura, vice president of cash services at SunAmerica's annuity unit.

But SunAmerica's information technology department thought R/3 was technically superior, and the Los Angeles-based company eventually decided to go with SAP, said Matshura, who is managing the application rollout. A mix of finance-oriented R/3 modules is due to go into use at SunAmerica in October.

Charles Burns, the head of EPAC Post Meridian LLP's SAP consulting operation in Redwood, Pa., said more than half of his unit's projects include development work to make R/3's complexity from users. “If you have to go three screens deep into an application just to change a [financial] measurement, that can intimidate people,” Burns said.

Even inside SAP, “the feedback is that not as many people as we expected are using R/3,” said CEO Hasso Plattner. Managers often “delegate it to someone else because [the software] is not convenient enough,” he added. — Craig Stedman

Wayne, Pa.-based SAP America, Inc. said it will take “a couple months of hard work” to finalize the new packaging and pricing plan. SAP executives don't even know yet how many different business scenarios are needed: Plattner estimated the number could be as high as 20.

“They've got the story, but they don't have everything figured out yet,” said Steve Bonadio, a packaged software analyst at Hurwitz Group, Inc. in Framingham, Mass.

On the user interface front, SAP is working with graphic designers to come up with less stodgy screens that are more user-configurable than R/3 is now. It also is trying to reduce the amount of drilling down through multiple screens that users have to do to complete even simple tasks, Plattner said.

For users, making R/3 less difficult to use could mean lower training costs.

Gleason Corp., a Rochester, N.Y., manufacturer of gear-making equipment, is looking at rolling out R/3 to about 1,000 users. Being able to minimize training “would save us one heck of a big amount of money,” said Wayne Parrish, a senior staff technical analyst at Gleason. □

Lotus releases Notes public beta

By Roberto Passaro

USERS WHO HAVE BEEN anticipating Release 5.0 of Lotus Notes and Domino next quarter won't be disappointed, despite a delay in the public beta version, company officials said.

Catbridge, Mass.-based Lotus Development Corp. last week posted on its World Wide Web site the first public beta of Release 5.0 of its Lotus Notes collaboration software. Domino server and Domino Designer development environment. The beta versions are at www.lotus.com/gwvnet/.

The public beta of Notes 5.0 was originally due at the end of last month but was delayed a few weeks. Officials and users at that time said they weren't sure if the delay would keep Lo-

tus from meeting its fourth-quarter shipping target. But Lotus spokesmen said they are confident the product will ship late in the fourth quarter. Pricing will be announced then.

Product designers took the extra time to tweak the messaging software's new user interface, which boasts a browser look and feel, spokesmen said.

Among the new features in Notes 5.0 and Domino 5.0 are enhanced navigation, including window tabs that will make it easier for users to find frequently used information. Domino 5.0 also has a native Lightweight Directory Access Protocol Version 3 directory. The two new versions also will offer full-over and load-balancing support for browsers to facilitate work over the Web. □

ERP can hit service

CONTINUED FROM PAGE 1

shared among several departments, users said.

In addition, the complex application interfaces of ERP systems have resulted in steep learning curves for workers in customer service. For example, Du Pont External Affairs in Wilmington, Del., is in the midst of an R/3 rollout but is developing a customized user interface to the software that will make it easier for customer service representatives — and eventually customers — to navigate, said Jim Sines, manager of customer care services.

Companies that use the interfaces exchanged face a long training period. Pharmaceutical giant Warner-Lambert Co. in Morris Plains, N.J., trained its customer service representatives for six months on its new R/3 system. During that time, the company had to hire extra employees to cover for workers in training classes.

Using “some of these packages [is] about as tough as finding a book in the Library of Congress” without a good in-

dex, said Marty Light, a customer service manager at Selcor Corp., a Hickory, N.C., maker of fiber-optic products.

Customer service professionals said ERP systems will greatly improve customer service over time, and the World Wide Web will be key. Several companies said they will eventually give customers direct access to data stored in ERP systems via the Web. That will let customers order products, check shipments and review inventory without the assistance of a customer service representative.

But before they can do that, companies need to solve the usability and performance issues of ERP systems, attendees said. In addition to customized user interfaces, some have built data

STRETCH ONE-TWO-THREE

Millennium madness

Crooner Pat Boone has taken a break from his brief fling with heavy metal to support a new cause: raising awareness of the year 2000 problem. Boone recorded a public service announcement [which radio stations can download from www.patboone.com] that offers a free information kit to help families prepare for the millennium bug.

A public opinion poll says 68% of Americans are ignorant of the year 2000 problem. And, when it is described to them, 54% said they aren't afraid because they figure it will be fixed in time. The poll was sponsored by developers of yet another Web site devoted to year 2000 information (www.y2ktoday.com).

In response to customer requests, PhotoDisc, Inc. in Seattle is offering a CD-ROM of stock photos depicting the new millennium. The images include a crystal ball, hourglass, clocks, calendars, time bombs and PC screens with explosions. How original.

THE FIFTH WAVE by Rick Tennant

"If I'm not gaining weight, then why does this digital image take up 3MB more memory than a computer one taken six months ago?"

Inside Lines

You mean not just for the sun?

Microsoft pulled out at itself last week during a late-and-midnight speech at the Software Publishers Association's annual conference. Ted Nelson, head of developer relations at Microsoft, opened a keynote with the "Top 10 lists" considered for today's "Top to Bat." Self-deprecating — and dare I say — honest included "Top 10 state attorneys general upset with Microsoft right now" and "Top 10 reasons Ralph Nader is an advocate for computer users." But most timely, given the latest anti-Microsoft outbreak from Sen. Chris Hatch (R-Utah), was Nelson's nod to Washington "Top 10 motivators for software companies to get more involved in politics."

There's a reason they write software

Songwriter Johnny Mercer must have been rolling over in his grave last week after someone at SAP AG co-opted Mercer's "Honey for Hollywood" for the multi-decade entertainment portion of CEO Hasso Plattner's keynote speech at SAP's "All in Los Angeles." A sample of SAP's version [which was backed up with insider transcripts and an 18-member chorus sang "We really want you to join the spotlight everyone here it's all one person and friends, this message we are sending you a happy ending/Sapientia is Hollywood." Afterward, Plattner pointed — three times — that SAP will make its software "load every bit as good as the girls" in the dance troupe.

No really, get outta here!

The Federal Trade Commission (FTC) for the first time is about to ban a broadcaster from the Internet for its. Craig Lee Hays, a Lake Worth, Fla., man who ran an online site circulating competitor, collected the money but never quite managed to deliver the goods to "successful" bidder. Hays will quit out of jail, but he'll never again be allowed to advertise, market or sell goods or services via the Internet, according to a settlement reached with the FTC in a Florida federal court.

And how sophisticated is that, exactly?

In this era for child sports jackets? A J. D. Power and Associates study released last week revealed that 35% of all new vehicle buyers use the Internet to get product and pricing data during the shopping process. "Consumers surfing the Internet for information related to an auto purchase could be one hour become more informed about a particular vehicle than even the most sophisticated salesperson," according to Chris Diener, J. D. Power's director of consulting operations.

Overboard

After last week's trouble with the New York Times Web site last week, one competitor wasn't impressed, grumbling, "I don't think they'd really do anything like grab the content to that damned crossover patch. Now that would have been something." ... Sen. Chris Hatch at David Cassady's Upstate Summit, on NH Circuit "That Jack." ... Oracle CEO Larry Ellison at a press conference last week, on Bill Gates: "The Pope of Personal Computing." ... Ellison on Microsoft: "Hopefully not [that] John Calkins" of computing. ... At a customer service conference last week in Seattle during a session on How to Open up Your Company to Customers via the Web: "If it was up to IT, we wouldn't publish our telephone number."

If the ball bounces, Brady Bunch movies and new VW Beetles haven't tipped you off that the U.S. has fallen into a cultural time warp back to the '70s, the latest marketing nugget from Intelsat Corp. just might. To show how hip an upcoming San Jose, Calif., reception will be, the company sent out what appear to be Pat Boone instead of "Intelsat ROCKS." Grocery. When you're shelling out \$4,000,000
to ring in the Year 2000, remember:

SAS[®] software didn't drop the ball.

While other software companies scramble to help you adapt your programs to handle the Year 2000 crisis, SAS Institute has just one question: *What crisis?* SAS software tools—from data warehousing to data mining, OLAP to analytical solutions—are Year 2000 compliant and do not have 2-digit year dependencies. And you can easily change the interpretation of any 2-digit years in existing programs.

SAS software customers won't need to shell out the estimated \$3-\$4 million it will cost the average company to address the Year 2000 issue. So isn't it time you invested in the world's most intelligent decision support software? From a vendor that will keep you on the leading edge of technology into the new millennium—and beyond? Just visit us at www.sas.com/y2k or call 919-677-8200.

The Business of Better Decision Making

The Framework Is FREE. The Benefits Are Invaluable.

Time is money.

And, in today's competitive market, producing more with less has become something of a chorus for IT managers. But now there's an amazing new product that can solve your integration issues in a matter of days, rather than years. A state-of-the-art framework that manages your entire heterogeneous environment from a cross-platform perspective.

**The Unicenter TMS
Framework Saves
You Time And
Costs You Nothing.**

The Unicenter™ TNG™ Framework™ provides all the features you'll ever need to ensure a complete and robust enterprise solution. Distributed services, like an object repository, auto discovery, event and calendar management, reporting, and virus detection, as

Unicenter TNS uses virtual reality to create a 3-D environment representing objects in the real world.

well as the revolutionary 3-D Real World interface™ that incorporates virtual reality to help you navigate through your entire enterprise.

Total
Enterprise
Management

Unicenter TNG

The Framework, in conjunction with Unicenter TNG, the world-class enterprise management solution, brings you a completely extensible infrastructure with more than 50 additional management functions.

And, with literally hundreds of third-party solutions available for the Framework, time is no longer a commodity. Plug your own management applications into the Unicenter TNG Framework, and take advantage of the world's most reliable and widely used core support service available.

**Enhanced Enterprise Management
Across Any Platform.**

Why ask your development team to spend the next five years building new solutions from scratch, when you can use the Framework as your foundation?

With the Framework, out-of-the-box integration is a reality. Today, more than 15 companies are shipping the Unicenter TNG Framework with their systems

**Unicenter TMO Is Widely
Recognized As The Industry
Standard For Network And
Systems Management.**

Unicenter TNG is the most open, interoperable and scalable management solution available. It has been supported by virtually every major hardware and software company, including Microsoft, Sun, SAP, Intel, HP, DIGITAL, Tandem, NCR, SGI, and Data General. Peter Kastner from the Aberdeen Group recently summed it up when he said, "Aberdeen positions the Framework as the enterprise management entry-level user choice and *de facto* ISV platform choice."
